Package 'hpgltools'

February 1, 2019

Type Package

Title A pile of (hopefully) useful R functions

Version 2018.11 Date 2018-03-01

Author Ashton Trey Belew, Keith Hughitt

Maintainer Ashton Trey Belew <abelew@gmail.com>

Description This is a set of functions I have been using in my various analyses in the El-Sayed laboratory. The set of tasks included herein run a spectrum from preprocessing count-tables from RNAseq-like data, through differential expression analyses, to post-processing tasks like gene ontology enrichment. Along the way, these function seek to make plotting analyses consistent, provide multiple entry-points to the various tools, and handle corner cases which are not flexibly handled by the packages this is based upon.

all_adjusters 11

all_adjusters	Combine all surrogate estimators and batch correctors into one function.
---------------	--

Description

For a long time, I have mostly kept my surrogate estimators and batch correctors separate. However, that separation was not complete, and it really did not make sense. This function brings them together. This now contains all the logic from the freshly deprecated get_model_adjust().

Usage

```
all_adjusters(input, design = NULL, estimate_type = "sva",
batch1 = "batch", batch2 = NULL, surrogates = "be",
expt_state = NULL, confounders = NULL, ...)
```

Arguments

input	Dataframe or expt or whatever as the data to analyze/modify.
design	If the data is not an expt, then put the design here.
estimate_type	Name of the estimator.
batch1	Column in the experimental design for the first known batch.
batch2	Only used by the limma method, a second batch column.
surrogates	Either a number of surrogates or a method to search for them.
expt_state	If this is not an expt, provide the state of the data here.
confounders	List of confounded factors for smartSVA/iSVA.

Extra arguments passed along to other methods.

Details

This applies the methodologies very nicely explained by Jeff Leek at https://github.com/jtleek/svaseq/blob/master/recount.Rn and attempts to use them to acquire estimates which may be applied to an experimental model by either EdgeR, DESeq2, or limma. In addition, it modifies the count tables using these estimates so that one may play with the modified counts and view the changes (with PCA or heatmaps or whatever). Finally, it prints a couple of the plots shown by Leek in his document. In other words, this is entirely derivative of someone much smarter than me.

Value

List containing surrogate estimates, new counts, the models, and some plots, as available.

 ${\it all_ontology_searches} \ \ {\it Perform\ ontology\ searches\ given\ the\ results\ of\ a\ differential\ expression} \\ analysis.$

Description

This takes a set of differential expression results, extracts a subset of up/down expressed genes; passes them to goseq, clusterProfiler, topGO, GOstats, and gProfiler; collects the outputs; and returns them in a (hopefully) consistent fashion. It attempts to handle the differing required annotation/GOid inputs required for each tool and/or provide supported species in ways which the various tools expect.

Usage

```
all_ontology_searches(de_out, gene_lengths = NULL, goids = NULL,
    n = NULL, z = NULL, lfc = NULL, p = NULL, overwrite = FALSE,
    species = "unsupported", orgdb = "org.Dm.eg.db",
    goid_map = "reference/go/id2go.map", gff_file = NULL,
    gff_type = "gene", do_goseq = TRUE, do_cluster = TRUE,
    do_topgo = TRUE, do_gostats = TRUE, do_gprofiler = TRUE,
    do_trees = FALSE, ...)
```

Arguments

de_out	List of topTables comprising limma/deseq/edger outputs.
gene_lengths	Data frame of gene lengths for goseq.
goids	Data frame of goids and genes.
n	Number of genes at the top/bottom of the fold-changes to define 'significant.'
Z	Number of standard deviations from the mean fold-change used to define 'significant.'
lfc	Log fold-change used to define 'significant'.
p	Maximum pvalue to define 'significant.'
overwrite	Overwrite existing excel results file?
species	Supported organism used by the tools.
orgdb	Provide an organismDbi/Orgdb to hold the various annotation data, in response to the shift of clusterprofiler and friends towards using them.
goid_map	Mapping file used by topGO, if it does not exist then goids_df creates it.
gff_file	gff file containing the annotations used by gff2genetable from clusterprofiler.
gff_type	Column to use from the gff file for the universe of genes.
do_goseq	Perform simple_goseq()?
do_cluster	Perform simple_clusterprofiler()?
do_topgo	Perform simple_topgo()?

all_pairwise 13

```
do_gostats Perform simple_gostats()?
do_gprofiler Perform simple_gprofiler()?
do_trees make topGO trees from the data?
... Arguments to pass through in arglist.
```

Value

a list of up/down ontology results from goseq/clusterprofiler/topgo/gostats, and associated trees.

See Also

goseq clusterProfiler topGO goStats gProfiler GO.db

Examples

all_pairwise

Perform limma, DESeq2, EdgeR pairwise analyses.

Description

This takes an expt object, collects the set of all possible pairwise comparisons, sets up experimental models appropriate for the differential expression analyses, and performs them.

Usage

```
all_pairwise(input = NULL, conditions = NULL, batches = NULL,
  model_cond = TRUE, modify_p = FALSE, model_batch = TRUE,
  model_intercept = FALSE, extra_contrasts = NULL, alt_model = NULL,
  libsize = NULL, test_pca = TRUE, annot_df = NULL,
  parallel = TRUE, do_basic = TRUE, do_deseq = TRUE,
  do_ebseq = NULL, do_edger = TRUE, do_limma = TRUE, ...)
```

Arguments

input Dataframe/vector or expt class containing count tables, normalization state, etc.

conditions Factor of conditions in the experiment.
batches Factor of batches in the experiment.

model_cond Include condition in the model? This is likely always true.

14 all_pairwise

modify_p	Depending on how it is used, sva may require a modification of the p-values.
model_batch	Include batch in the model? This may be true/false/"sva" or other methods supported by all_adjusters().
model_intercep	t
	Use an intercept model instead of cell means?
extra_contrast	
	Optional extra contrasts beyone the pairwise comparisons. This can be pretty neat, lets say one has conditions A,B,C,D,E and wants to do (C/B)/A and (E/D)/A or (E/D)/(C/B) then use this with a string like: "c_vs_b_ctrla = (C-B)-A, e_vs_d_ctrla = (E-D)-A, de_vs_cb = (E-D)-(C-B)".
alt_model	Alternate model to use rather than just condition/batch.
libsize	Library size of the original data to help voom().
test_pca	Perform some tests of the data before/after applying a given batch effect.
annot_df	Annotations to add to the result tables.
parallel	Use dopar to run limma, deseq, edger, and basic simultaneously.
do_basic	Perform a basic analysis?
do_deseq	Perform DESeq2 pairwise?
do_ebseq	Perform EBSeq (caveat, this is NULL as opposed to TRUE/FALSE so it can choose).
do_edger	Perform EdgeR?
do_limma	Perform limma?
	Picks up extra arguments into arglist, currently only passed to write_limma().

Details

Tested in test_29de_shared.R This runs limma_pairwise(), deseq_pairwise(), edger_pairwise(), basic_pairwise() each in turn. It collects the results and does some simple comparisons among them.

Value

A list of limma, deseq, edger results.

See Also

 $\mathbf{limma} \ \mathbf{DESeq2} \ \mathbf{edgeR} \ \mathsf{link} \\ \{\mathsf{limma_pairwise}\} \ \mathsf{deseq_pairwise} \ \mathsf{edger_pairwise} \ \mathsf{basic_pairwise} \\$

Examples

```
## Not run:
  lotsodata <- all_pairwise(input=expt, model_batch="svaseq")
  summary(lotsodata)
  ## limma, edger, deseq, basic results; plots; and summaries.
## End(Not run)</pre>
```

backup_file 15

backup_file

Make a backup of an existing file with n revisions, like VMS!

Description

Sometimes I just want to kick myself for overwriting important files and then I remember using VMS and wish modern computers were a little more like it.

Usage

```
backup_file(backup_file, backups = 4)
```

Arguments

backup_file Filename to backup.

backups How many revisions?

base_size

The following sets the ggplot2 default text size.

Description

The following sets the ggplot2 default text size.

Usage

base_size

Format

An object of class numeric of length 1.

16 basic_pairwise

basic_pairwise The simplest possible differential expression method.

Description

Perform a pairwise comparison among conditions which takes nothing into account. It _only_ takes the conditions, a mean value/variance among them, divides by condition, and returns the result. No fancy nomalizations, no statistical models, no nothing. It should be the very worst method possible. But, it should also provide a baseline to compare the other tools against, they should all do better than this, always.

Usage

```
basic_pairwise(input = NULL, design = NULL, conditions = NULL,
batches = NULL, model_cond = TRUE, model_intercept = FALSE,
alt_model = NULL, model_batch = FALSE, force = FALSE, ...)
```

Arguments

input	Count table by sample.
design	Data frame of samples and conditions.
conditions	Not currently used, but passed from all_pairwise()
batches	Not currently used, but passed from all_pairwise()
model_cond	Not currently used, but passed from all_pairwise()
model_intercep	t
	Not currently used, but passed from all_pairwise()
alt_model	Not currently used, but passed from all_pairwise()
model_batch	Not currently used, but passed from all_pairwise()
force	Force as input non-normalized data?
	Extra options passed to arglist.

Details

Tested in test_27de_basic.R This function was written after the corresponding functions in de_deseq.R, de_edger.R, and de_limma.R. Like those, it performs the full set of pairwise comparisons and returns a list of the results. As mentioned above, unlike those, it is purposefully stupid.

Value

Df of pseudo-logFC, p-values, numerators, and denominators.

See Also

limma DESeq2 edgeR

batch_counts 17

Examples

```
## Not run:
stupid_de <- basic_pairwise(expt)
## End(Not run)</pre>
```

batch_counts

Perform different batch corrections using limma, sva, ruvg, and cbcb-

SEQ.

Description

I found this note which is the clearest explanation of what happens with batch effect data: https://support.bioconductor.org/p/7 Just to be clear, there's an important difference between removing a batch effect and modelling a batch effect. Including the batch in your design formula will model the batch effect in the regression step, which means that the raw data are not modified (so the batch effect is not removed), but instead the regression will estimate the size of the batch effect and subtract it out when performing all other tests. In addition, the model's residual degrees of freedom will be reduced appropriately to reflect the fact that some degrees of freedom were "spent" modelling the batch effects. This is the preferred approach for any method that is capable of using it (this includes DESeq2). You would only remove the batch effect (e.g. using limma's removeBatchEffect function) if you were going to do some kind of downstream analysis that can't model the batch effects, such as training a classifier. I don't have experience with ComBat, but I would expect that you run it on log-transformed CPM values, while DESeq2 expects raw counts as input. I couldn't tell you how to properly use the two methods together.

Usage

```
batch_counts(count_table, design, batch = TRUE, batch1 = "batch",
   expt_state = NULL, batch2 = NULL, noscale = TRUE, ...)
```

Matrix of (nseudo)counts

Arguments

count table

Count_table	Wattix of (pseudo)counts.
design	Model matrix defining the experimental conditions/batches/etc.
batch	String describing the method to try to remove the batch effect (or FALSE to leave it alone, TRUE uses limma).
batch1	Column in the design table describing the presumed covariant to remove.
expt_state	Current state of the expt in an attempt to avoid double-normalization.
batch2	Column in the design table describing the second covariant to remove (only used by limma at the moment).
noscale	Used for combatmod, when true it removes the scaling parameter from the invocation of the modified combat.
	More options for you!

18 bioc_all

Value

The 'batch corrected' count table and new library size. Please remember that the library size which comes out of this may not be what you want for voom/limma and would therefore lead to spurious differential expression values.

See Also

limma edgeR RUVSeq sva cbcbSEQ

Examples

```
## Not run:
  limma_batch <- batch_counts(table, design, batch1='batch', batch2='strain')
  sva_batch <- batch_counts(table, design, batch='sva')
## End(Not run)</pre>
```

bioc_all

Grab a copy of all bioconductor packages and install them by type

Description

This uses jsonlite to get a copy of all bioconductor packages by name and then iterates through them with BiocInstaller to install all of them. It performs a sleep between each installation in an attempt to avoid being obnoxious. As a result, it will of a necessity take forever.

Usage

```
bioc_all(release = "3.5",
  mirror = "bioconductor.statistik.tu-dortmund.de", base = "packages",
  type = "software", suppress_updates = TRUE, suppress_auto = TRUE,
  force = FALSE)
```

Arguments

release Bioconductor release to use, should probably be adjusted to automatically find

it.

mirror Bioconductor mirror to use.

base Base directory on the mirror to download from.

type Type in the tree to use (software or annotation)

suppress_updates

For BiocLite(), don't update?

suppress_auto For BiocLite(), don't update? force Install if already installed? cbcb_batch 19

Value

a number of packages installed

See Also

BiocInstaller

Examples

```
## Not run:
    go_get_some_coffee_this_will_take_a_while <- bioc_all()
## End(Not run)</pre>
```

cbcb_batch

A function suggested by Hector Corrada Bravo and Kwame Okrah for batch removal.

Description

During a lab meeting, the following function was suggested as a quick and dirty batch removal tool. It takes data and a model including a 'batch' factor, invokes limma on them, removes the batch factor, does a cross product of the fitted data and modified model and uses that with residuals to get a new data set.

Usage

```
cbcb_batch(normalized_counts, model, batch1 = "batch",
  condition = "condition", matrix_scale = "linear",
  return_scale = "linear", method = "subtract")
```

Arguments

normalized_counts

Data frame of log2cpm counts.

model

Balanced experimental model containing condition and batch factors.

Value

Dataframe of residuals after subtracting batch from the model.

See Also

```
limma voom lmFit
```

20 cbcb_combat

Examples

```
## Not run:
  newdata <- cbcb_batch_effect(counts, expt_model)
## End(Not run)</pre>
```

cbcb_combat

A modified version of comBatMod.

Description

This is a hack of Kwame Okrah's combatMod to make it not fail on corner-cases. This was mostly copy/pasted from https://github.com/kokrah/cbcbSEQ/blob/master/R/transform.R

Usage

```
cbcb_combat(dat, batch, mod, noscale = TRUE, prior.plots = FALSE, ...)
```

Arguments

dat Df to modify.
batch Factor of batches.
mod Factor of conditions.

noscale The normal 'scale' option squishes the data too much, so this defaults to TRUE.

prior.plots Print out prior plots?

. . . Extra options are passed to arglist

Value

Df of batch corrected data

See Also

```
sva ComBat
```

Examples

```
## Not run:
    df_new = cbcb_combat(df, batches, model)
## End(Not run)
```

cbcb_filter_counts 21

cbcb_filter_counts

Filter low-count genes from a data set using cpm data and a threshold.

Description

This was a function written by Kwame Okrah and perhaps also Laura Dillon to remove low-count genes. It drops genes based on a cpm threshold and number of samples.

Usage

```
cbcb_filter_counts(count_table, threshold = 1, min_samples = 2,
   libsize = NULL)
```

Arguments

count_table Data frame of (pseudo)counts by sample.
threshold Lower threshold of counts for each gene.

min_samples Minimum number of samples.

libsize Table of library sizes.

Value

Dataframe of counts without the low-count genes.

See Also

edgeR

Examples

```
## Not run:
  filtered_table <- cbcb_filter_counts(count_table)
## End(Not run)</pre>
```

check_eupath_species

Search the eupathdb metadata for a given species substring.

Description

When querying the eupathdb, it can be difficult to hit the desired species. This is confounded by the fact that there are very similar named species across different EupathDB projects. Thus function seeks to make it a bit easier to find the actual dataset desired. If the specific species is not found, look for a reasonably approximation. stop() if nothing is found.

22 check_plot_scale

Usage

```
check_eupath_species(species = "Leishmania major strain Friedlin",
   metadata = NULL, ...)
```

Arguments

species String containing some reasonably unique text in the desired species name.

metadata The Eupathdb metadata dataframe/table to query.

... This function does not assume that the metadata has already been downloaded,

if it indeed has not, then it will invoke download_eupath_metadata(), extra ar-

guments for it go here.

Value

A single row from the eupathdb metadata.

Author(s)

atb

<pre>check_plot_scale</pre>	Look at the range of the data for a plot and use it to suggest if a plot
	should be on log scale.

Description

There are a bunch of plots which often-but-not-always benefit from being displayed on a log scale rather than base 10. This is a quick and dirty heuristic which suggests the appropriate scale. If the data 'should' be on the log scale and it has 0s, then they are moved to 1 so that when logged they will return to 0. Similarly, if there are negative numbers and the intended scale is log, then this will set values less than 0 to zero to avoid imaginary numbers.

Usage

```
check_plot_scale(data, scale = NULL, max_data = 10000, min_data = 10)
```

Arguments

data	Data to plot.
scale	If known, this will be used to define what (if any) values to change.
max_data	Define the upper limit for the heuristic.
min_data	Define the lower limit for the heuristic.

choose_basic_dataset 23

Description

basic_pairwise() assumes log2 data as input, use this to ensure that is true.

Usage

```
choose_basic_dataset(input, force = FALSE, ...)
```

Arguments

input An expressionset containing expt to test and/or modify.

force If we want to try out other distributed data sets, force it in using me.

... future options, I think currently unused.

Value

data ready for basic_pairwise()

See Also

Biobase

Examples

```
## Not run:
  ready <- choose_basic_dataset(expt)
## End(Not run)</pre>
```

choose_binom_dataset

A sanity check that a given set of data is suitable for methods which assume a negative binomial distribution of input.

Description

Take an expt and poke at it to ensure that it will not result in troubled results.

Usage

```
choose_binom_dataset(input, force = FALSE, ...)
```

24 choose_dataset

Arguments

input Expressionset containing expt object.

force Ignore every warning and just use this data.

... Extra arguments passed to arglist.

Details

Invoked by deseq_pairwise() and edger_pairwise().

Value

dataset suitable for limma analysis

See Also

DESeq2 edgeR

choose_dataset

Choose a suitable data set for Edger/DESeq

Description

The _pairwise family of functions all demand data in specific formats. This tries to make that consistent.

Usage

```
choose_dataset(input, choose_for = "limma", force = FALSE, ...)
```

Arguments

input Expt input.

choose_for One of limma, deseq, edger, or basic. Defines the requested data state.

force Force non-standard data?

... More options for future expansion.

Details

Invoked by _pairwise().

Value

List the data, conditions, and batches in the data.

See Also

choose_binom_dataset choose_limma_dataset choose_basic_dataset

choose_limma_dataset 25

Examples

```
## Not run:
starting_data <- create_expt(metadata)
modified_data <- normalize_expt(starting_data, transform="log2", norm="quant")
a_dataset <- choose_dataset(modified_data, choose_for="deseq")
## choose_dataset should see that log2 data is inappropriate for DESeq2 and
## return it to a base10 state.
## End(Not run)</pre>
```

choose_limma_dataset A sanity check that a given set of data is suitable for analysis by limma.

Description

Take an expt and poke at it to ensure that it will not result in troubled limma results.

Usage

```
choose_limma_dataset(input, force = FALSE, which_voom = "limma", ...)
```

Arguments

input Expressionset containing expt object.

force Ingore warnings and use the provided data asis.

which_voom Choose between limma's voom, voomWithQualityWeights, or the hpgl equiva-

lents.

... Extra arguments passed to arglist.

Value

dataset suitable for limma analysis

See Also

limma

26 choose_model

choose_model	Try out a few experimental models and return a likely working option.
choose_mode1	Try our a few experimental models and return a tikety working option.

Description

The _pairwise family of functions all demand an experimental model. This tries to choose a consistent and useful model for all for them. This does not try to do multi-factor, interacting, nor dependent variable models, if you want those do them yourself and pass them off as alt_model.

Usage

```
choose_model(input, conditions = NULL, batches = NULL,
  model_batch = TRUE, model_cond = TRUE, model_intercept = FALSE,
  alt_model = NULL, alt_string = NULL, intercept = 0,
  reverse = FALSE, contr = NULL, surrogates = "be", ...)
```

Arguments

input Input data used to make the model. conditions Factor of conditions in the putative model. batches Factor of batches in the putative model. model_batch Try to include batch in the model? model_cond Try to include condition in the model? (Yes!) model_intercept Use an intercept model instead of cell-means? Use your own model. alt_model String describing an alternate model. alt_string Choose an intercept for the model as opposed to 0. intercept Reverse condition/batch in the model? This shouldn't/doesn't matter but I wanted reverse to test. List of contrasts.arg possibilities. contr Number of or method used to choose the number of surrogate variables. surrogates Further options are passed to arglist.

Details

Invoked by the _pairwise() functions.

Value

List including a model matrix and strings describing cell-means and intercept models.

See Also

```
stats model.matrix
```

circos_arc 27

Examples

```
## Not run:
   a_model <- choose_model(expt, model_batch=TRUE, model_intercept=FALSE)
   a_model$chosen_model
   ## ~ 0 + condition + batch
## End(Not run)</pre>
```

circos_arc

Write arcs between chromosomes in circos.

Description

Ok, so when I said I only do 1 chromosome images, I lied. This function tries to make writing arcs between chromosomes easier. It too works in 3 stages, It writes out a data file using cfgout as a basename and the data from df in the circos arc format into circos/data/bob_arc.txt It then writes out a configuration plot stanza in circos/conf/bob_arc.conf and finally adds an include to circos/bob.conf

Usage

```
circos_arc(df, cfgout = "circos/conf/default.conf", first_col = "chr1",
  second_col = "chr2", color = "blue", radius = 0.75,
  thickness = 3)
```

Arguments

df Dataframe with starts/ends and the floating point information.

cfgout Master configuration file to write.

first_col Name of the first chromosome.

second_col Name of the second chromosome.

color Color of the chromosomes.

radius Outer radius at which to add the arcs.

thickness Integer thickness of the arcs.

Details

In its current implementation, this only understands two chromosomes. A minimal amount of logic and data organization will address this weakness.

Value

The file to which the arc configuration information was written.

28 circos_heatmap

circos_heatmap	Write tiles of arbitrary heat-mappable data in circos.	

Description

This function tries to make the writing circos heatmaps easier. Like circos_plus_minus() and circos_hist() it works in 3 stages, It writes out a data file using cfgout as a basename and the data from df in the circos histogram format into circos/data/bob_heatmap.txt It then writes out a configuration plot stanza in circos/conf/bob_heatmap.conf and finally adds an include to circos/bob.conf

Usage

```
circos_heatmap(df, annot_df, cfgout = "circos/conf/default.conf",
  colname = "logFC", color_mapping = 0, min_value = NULL,
  max_value = NULL, chr = "chr1", basename = "", colors = NULL,
  color_choice = "spectral-9-div", scale_log_base = 1, outer = 0.9,
  rules = NULL, width = 0.08, spacing = 0.02)
```

Arguments

df	Dataframe with starts/ends and the floating point in	C
OT.	I jajajramė wijo siarisienos and the iloaling noini ir	uarmanan

annot_df Annotation data frame with starts/ends.
cfgout Master configuration file to write.

colname Name of the column with the data of interest.

color_mapping 0 means no overflows for min/max, 1 means overflows of min get a chosen color,

2 means overflows of both min/max get chosen colors.

min_value Minimum value for the data.

max_value Maximum value for the data.

chr Name of the chromosome (This currently assumes a bacterial chromosome).

basename Make sure the written configuration files get different names with this.

colors Colors of the heat map.

color_choice Name of the heatmap to use, I forget how this interacts with color...

scale_log_base Defines how the range of colors will be ranged with respect to the values in the

data.

outer Floating point radius of the circle into which to place the heatmap.

rules some extra rules?

width Width of each tile in the heatmap.

spacing Radial distance between outer, inner, and inner to whatever follows.

Value

Radius after adding the histogram and the spacing.

circos_hist 29

circos_hist	Write histograms of arbitrary floating point data in circos.

Description

This function tries to make the writing of histogram data in circos easier. Like circos_plus_minus() it works in 3 stages, It writes out a data file using cfgout as a basename and the data from df in the circos histogram format into circos/data/bob_hist.txt It then writes out a configuration plot stanza in circos/conf/bob_hist.conf and finally adds an include to circos/bob.conf

Usage

```
circos_hist(df, annot_df, cfgout = "circos/conf/default.conf",
  colname = "logFC", chr = "chr1", basename = "", color = "blue",
  fill_color = "blue", outer = 0.9, width = 0.08, spacing = 0)
```

Arguments

df	Dataframe with starts/ends and the floating point information.
annot_df	Annotation data frame containing starts/ends.
cfgout	Master configuration file to write.
colname	Name of the column with the data of interest.
chr	Name of the chromosome (This currently assumes a bacterial chromosome).
basename	Location to write the circos data (usually cwd).
color	Color of the plotted data.
fill_color	Guess!
outer	Floating point radius of the circle into which to place the data.
width	Radial width of each tile.

Distance between outer, inner, and inner to whatever follows.

Value

spacing

Radius after adding the histogram and the spacing.

30 circos_ideogram

circos_ideogram

Create the description of chromosome markings.

Description

This function writes ideogram files for circos.

Usage

```
circos_ideogram(name = "default", conf_dir = "circos/conf",
band_url = NULL, fill = "yes", stroke_color = "black",
thickness = "20", stroke_thickness = "2", fill_color = "black",
radius = "0.85", label_size = "36", band_stroke_thickness = "2")
```

Arguments

name Name of the configuration file to which to add the ideogram.

conf_dir Where does the configuration live?

band_url Provide a url for making these imagemaps?

fill Fill in the strokes?

stroke_color What color?

thickness How thick to color the lines

stroke_thickness

How much of them to fill in

fill_color What color to fill

radius Where on the circle to put them

label_size How large to make the labels in px.

band_stroke_thickness

How big to make the strokes!

Value

The file to which the ideogram configuration was written.

circos_karyotype 31

circos_karyotype

Create the description of (a)chromosome(s) for circos.

Description

This function tries to save me from having to get the lengths of arcs for bacterial chromosomes manually correct, and writes them as a circos compatible karyotype file. The outfile parameter was chosen to match the configuration directive outlined in circos_prefix(), however that will need to be changed in order for this to work in variable conditions. Next time I make one of these graphs I will do that I suspect. In addition, this currently only understands how to write bacterial chromosomes, that will likely be fixed when I am asked to write out a L.major karyotype. These defaults were chosen because I have a chromosome of this length that is correct.

Usage

```
circos_karyotype(name = "default", conf_dir = "circos/conf",
  length = NULL, chr_name = "chr1", segments = 6, color = "white",
  chr_num = 1, fasta = NULL)
```

Arguments

name	Name of the chromosome (This currently assumes a bacterial chromosome).
conf_dir	Where to put the circos configuration file(s).
length	Length of the chromosome (the default is mgas5005).
chr_name	Short name of the chromosome.
segments	How many segments to cut the chromosome into?
color	Color segments of the chromosomal arc?
chr_num	Number to record for each chromosome.
fasta	Fasta file to use to create the karyotype.

Value

The output filename.

circos_make

Write a simple makefile for circos.

Description

I regenerate all my circos pictures with make(1). This is my makefile.

Usage

```
circos_make(target = "", output = "circos/Makefile",
  circos = "circos")
```

32 circos_plus_minus

Arguments

target Default make target.
output Makefile to write.

circos Location of circos. I have a copy in home/bin/circos and use that sometimes.

Value

a kitten

circos_plus_minus Write tiles of bacterial ontology groups using the categories from microbesonline.org.

Description

This function tries to save me from writing out ontology definitions and likely making mistakes. It uses the start/ends from the gff annotation along with the 1 letter GO-like categories from microbesonline.org. It then writes two data files circos/data/bob_plus_go.txt, circos/data/bob_minus_go.txt along with two configuration files circos/conf/bob_minus_go.conf and circos/conf/bob_plus_go.conf and finally adds an include to circos/bob.conf

Usage

```
circos_plus_minus(table, cfgout = "circos/conf/default.conf",
    chr = "chr1", outer = 1, width = 0.08, spacing = 0,
    acol = "orange", bcol = "reds-9-seq", ccol = "yellow",
    dcol = "vlpurple", ecol = "vlgreen", fcol = "dpblue",
    gcol = "vlgreen", hcol = "vlpblue", icol = "vvdpgreen",
    jcol = "dpred", kcol = "orange", lcol = "vvlorange",
    mcol = "dpgreen", ncol = "vvlpblue", ocol = "vvlgreen",
    pcol = "vvdpred", qcol = "ylgn-3-seq", rcol = "vlgrey",
    scol = "grey", tcol = "vlpurple", ucol = "greens-3-seq",
    vcol = "vlred", wcol = "vvdppurple", xcol = "black",
    ycol = "lred", zcol = "vlpblue")
```

Arguments

table	Dataframe with starts/ends and categories.
cfgout	Master configuration file to write.
chr	Name of the chromosome.
outer	Floating point radius of the circle into which to place the plus-strand data.
width	Radial width of each tile.
spacing	Radial distance between outer, inner, and inner to whatever follows.
acol	A color: RNA processing and modification.

circos_plus_minus 33

bcol	B color: Chromatin structure and dynamics.
ccol	C color: Energy production conversion.
dcol	D color: Cell cycle control, mitosis and meiosis.
ecol	E color: Amino acid transport metabolism.
fcol	F color: Nucleotide transport and metabolism.
gcol	G color: Carbohydrate transport and metabolism.
hcol	H color: Coenzyme transport and metabolism.
icol	I color: Lipid transport and metabolism.
jcol	J color: Translation, ribosome structure and biogenesis.
kcol	K color: Transcription.
lcol	L color: Replication, recombination, and repair.
mcol	M color: Cell wall/membrane biogenesis.
ncol	N color: Cell motility
ocol	O color: Posttranslational modification, protein turnover, chaperones.
pcol	P color: Inorganic ion transport and metabolism.
qcol	Q color: Secondary metabolite biosynthesis, transport, and catabolism.
rcol	R color: General function prediction only.
scol	S color: Function unknown.
tcol	T color: Signal transduction mechanisms.
ucol	U color: Intracellular trafficking(sp?) and secretion.
vcol	V color: Defense mechanisms.
wcol	W color: Extracellular structures.
xcol	X color: Not in COG.
ycol	Y color: Nuclear structure.
zcol	Z color: Cytoskeleton.

Value

Radius after adding the plus/minus information and the spacing between them.

34 circos_suffix

circos_prefix	Write the beginning of a circos configuration file.	

Description

A few parameters need to be set when starting circos. This sets some of them and gets ready for plot stanzas.

Usage

```
circos_prefix(name = "mgas", conf_dir = "circos/conf", radius = 1800,
    chr_units = 1000, band_url = NULL, ...)
```

Arguments

name Name of the map, called with 'make name'.

conf_dir Directory containing the circos configuration data.

radius Size of the image.

chr_units How often to print chromosome in 'prefix' units.

band_url Place to imagemap link.

... Extra arguments passed to the tick/karyotype makers.

Details

In its current implementation, this really assumes that there will be no highlight stanzas and at most 1 link stanza. chromosomes. A minimal amount of logic and data organization will address these weaknesses.

Value

The master configuration file name.

circos_suffix	Write the end of a circos master configuration.	

Description

circos configuration files need an ending. This writes it.

Usage

```
circos_suffix(cfgout = "circos/conf/default.conf")
```

circos_ticks 35

Arguments

cfgout Master configuration file to write.

Value

The filename of the configuration.

circos_ticks

Create the ticks for a circos plot.

Description

This function writes ticks for circos. This has lots of options, the defaults are all taken from the circos example documentation for a bacterial genome.

Usage

```
circos_ticks(name = "default", conf_dir = "circos/conf",
   tick_separation = 2, min_label_distance = 0, label_separation = 5,
   label_offset = 5, label_size = 8, multiplier = 0.001,
   main_color = "black", main_thickness = 3, main_size = 20,
   first_size = 10, first_spacing = 1, first_color = "black",
   first_show_label = "no", first_label_size = 12, second_size = 15,
   second_spacing = 5, second_color = "black",
   second_show_label = "yes", second_label_size = 16, third_size = 18,
   third_spacing = 10, third_color = "black",
   third_show_label = "yes", third_label_size = 16,
   fourth_spacing = 100, fourth_color = "black",
   fourth_show_label = "yes", suffix = " kb", fourth_label_size = 36,
   include_first_label = TRUE, include_second_label = TRUE,
   include_third_label = TRUE, include_fourth_label = TRUE,
   include_third_label = TRUE, include_fourth_label = TRUE,
```

Arguments

Name of the configuration file to which to add the ideogram. name Where does the configuration live? conf_dir tick_separation Top-level separation between tick marks. min_label_distance distance to the edge of the plot for labels. label_separation radial distance between labels. label_offset The offset for the labels. label_size Top-level label size. multiplier When writing the position, by what factor to lower the numbers? 36 circos_ticks

Color for top-level labels? main_color main_thickness Top-level thickness of lines etc. main_size Top-level size of text. first_size Second level size of text. first_spacing Second level spacing of ticks. first_color Second-level text color. first_show_label Show a label for the second level ticks? first_label_size Text size for second level labels? Size of ticks for the third level. second_size second_spacing third-level spacing second color Text color for the third level. second_show_label Give them a label? second_label_size And a size. third_size Now for the size of the almost-largest ticks third_spacing How far apart? third_color and their color third_show_label give a label? third_label_size and a size. fourth_spacing The largest ticks! fourth_color The largest color. fourth_show_label Provide a label? suffix String for printing chromosome distances. fourth_label_size They are big! include_first_label Provide the smallest labels? include_second_label Second smallest labels? include_third_label Second biggest labels? include_fourth_label Largest labels?

Value

. . .

The file to which the ideogram configuration was written.

Extra arguments from circos_prefix().

circos_tile 37

circos_tile	Write tiles of arbitrary categorical point data in circos.	
circos_tile	Write tiles of arbitrary categorical point data in circos.	

Description

This function tries to make the writing circos tiles easier. Like circos_plus_minus() and circos_hist() it works in 3 stages, It writes out a data file using cfgout as a basename and the data from df in the circos histogram format into circos/data/bob_tile.txt It then writes out a configuration plot stanza in circos/conf/bob_tile.conf and finally adds an include to circos/bob.conf

Usage

```
circos_tile(df, annot_df = NULL, cfgout = "circos/conf/default.conf",
  colname = "logFC", chr = "chr1", basename = "", colors = NULL,
  thickness = 90, margin = 0, stroke_thickness = 0, padding = 0.1,
  outer = 0.9, width = 0.08, spacing = 0)
```

Arguments

df	Dataframe with	starts/ends and	the floating	point information.

annot_df Annotation data frame defining starts/stops.

cfgout Master configuration file to write.

colname Name of the column with the data of interest.

chr Name of the chromosome (This currently assumes a bacterial chromosome)

basename Used to make unique filenames for the data/conf files.

colors Colors of the data.

thickness How thick to make the tiles in radial units.

margin How much space between other rings and the tiles?

stroke_thickness

Size of the tile outlines.

padding Space between tiles.

outer Floating point radius of the circle into which to place the categorical data.

width Width of each tile.

spacing Radial distance between outer, inner, and inner to whatever follows.

Value

Radius after adding the histogram and the spacing.

38 clean_pkg

clean_pkg	Cleans up illegal characters in packages generated by make_organismdbi(), make_orgdb(), and make_txdb(). This at-
	tempts to fix some of the common problems therein.

Description

The primary problem this function seeks to solve is derived from the fact that some species names in the eupathdb contain characters which are not allowed in orgdb/txdb/organismdbi instances. Thus this invokes a couple of regular expressions in an attempt to make sure these generated packages are actually installable.

Usage

```
clean_pkg(path, removal = "-like", replace = "", sqlite = TRUE)
```

Arguments

path	Location for the original Db/Dbi instance.
removal	String to remove from the instance.
replace	What to replace removal with, when necessary.
sqlite	Also modify the sqlite database?

Details

One thing I should consider is to add some of this logic to my eupath queries rather than perform these clunky modifications to the already-generated packages.

Value

A hopefully cleaner OrgDb/TxDb/OrganismDbi sqlite package.

Author(s)

atb

clear_session 39

clear_session	Clear an R session, this is probably unwise given what I have read about R.
---------------	---

Description

Clear an R session, this is probably unwise given what I have read about R.

Usage

```
clear_session(keepers = NULL, depth = 10)
```

Arguments

keepers List of namespaces to leave alone (unimplemented).

depth Cheesy forloop of attempts to remove packages stops after this many tries.

Value

A spring-fresh R session, hopefully.

cleavage_histogram	Make a histogram of how many peptides are expected at every integer dalton from a given start to end size for a given enzyme digestion.
	auton from a given start to that size for a given enzyme argestion.

Description

This is very similar to plot_cleaved() above, but tries to be a little bit smarter.

Usage

```
cleavage_histogram(pep_sequences, enzyme = "trypsin", start = 600,
  end = 1500, color = "black")
```

Arguments

pep_sequences Protein sequences as per plot_cleaved().
enzyme Compatible enzyme name from cleaver.

start Print histogram from here

end to here.

color Make the bars this color.

Value

List containing the plot and size distribution.

40 cluster_trees

clus	ster	trees

Take clusterprofile group data and print it on a tree as per topGO.

Description

TopGO's ontology trees can be very illustrative. This function shoe-horns clusterProfiler data into the format expected by topGO and uses it to make those trees.

Usage

```
cluster_trees(de_genes, cpdata, goid_map = "id2go.map", go_db = NULL,
    score_limit = 0.2, overwrite = FALSE, selector = "topDiffGenes",
    pval_column = "adj.P.Val")
```

Arguments

de_genes	List of genes deemed 'interesting'.
cpdata	Data from simple_clusterprofiler().
goid_map	Mapping file of IDs to GO ontologies.
go_db	Dataframe of mappings used to build goid_map.
score_limit	Scoring limit above which to ignore genes.
overwrite	Overwrite an existing gold mapping file?
selector	Name of a function for applying scores to the trees.
pval column	Name of the column in the GO table from which to extract scores.

Value

```
plots! Trees! oh my!
```

See Also

Ramigo showSigOfNodes

Examples

```
## Not run:
   cluster_data <- simple_clusterprofiler(genes, stuff)
   ctrees <- cluster_trees(genes, cluster_data)
## End(Not run)</pre>
```

combine_de_tables 41

combine_de_tables

Combine portions of deseq/limma/edger table output.

Description

This hopefully makes it easy to compare the outputs from limma/DESeq2/EdgeR on a table-by-table basis.

Usage

```
combine_de_tables(apr, extra_annot = NULL, excel = NULL,
    sig_excel = NULL, abundant_excel = NULL,
    excel_title = "Table SXXX: Combined Differential Expression of YYY",
    keepers = "all", excludes = NULL, adjp = TRUE,
    include_limma = TRUE, include_deseq = TRUE, include_edger = TRUE,
    include_ebseq = TRUE, include_basic = TRUE, rownames = TRUE,
    add_plots = TRUE, loess = FALSE, plot_dim = 6,
    compare_plots = TRUE, padj_type = "fdr", ...)
```

Arguments

padj_type

Output from all_pairwise(). apr Add some annotation information? extra_annot Filename for the excel workbook, or null if not printed. excel sig_excel Filename for writing significant tables. abundant_excel Filename for writing abundance tables. Title for the excel sheet(s). If it has the string 'YYY', that will be replaced by excel_title the contrast name. List of reformatted table names to explicitly keep certain contrasts in specific keepers orders and orientations. excludes List of columns and patterns to use for excluding genes. Perhaps you do not want the adjusted p-values for plotting? adjp include_limma Include limma analyses in the table? include_deseq Include deseg analyses in the table? include_edger Include edger analyses in the table? include_ebseq Include ebseq analyses in the table? include_basic Include my stupid basic logFC tables? rownames Add rownames to the xlsx printed table? add_plots Add plots to the end of the sheets with expression values? loess Add time intensive loess estimation to plots? plot_dim Number of inches squared for the plot if added. compare_plots Add some plots comparing the results.

Add a consistent p adjustment of this type.

Arguments passed to significance and abundance tables.

Value

Table combining limma/edger/deseq outputs.

See Also

```
all_pairwise
```

Examples

combine_single_de_table

Given a limma, edger, and deseq table, combine them into one.

Description

This combines the outputs from the various differential expression tools and formalizes some column names to make them a little more consistent.

Usage

```
combine_single_de_table(li = NULL, ed = NULL, eb = NULL, de = NULL,
ba = NULL, table_name = "", annot_df = NULL, do_inverse = FALSE,
adjp = TRUE, padj_type = "fdr", include_deseq = TRUE,
include_edger = TRUE, include_ebseq = TRUE, include_limma = TRUE,
include_basic = TRUE, lfc_cutoff = 1, p_cutoff = 0.05,
excludes = NULL)
```

Arguments

li	Limma output table.
ed	Edger output table.
eb	EBSeq output table
de	DESeq2 output table.
ba	Basic output table.
table_name	Name of the table to merge.
annot_df	Add some annotation information?

compare_de_results 43

do_inverse Invert the fold changes? adjp Use adjusted p-values?

padj_type Add this consistent p-adjustment.

include_deseq Include tables from deseq?
include_edger Include tables from edger?
include_ebseq Include tables from ebseq?
include_limma Include tables from limma?
include_basic Include the basic table?

1fc_cutoff Preferred logfoldchange cutoff.

p_cutoff Preferred pvalue cutoff.

excludes Set of genes to exclude from the output.

Value

List containing a) Dataframe containing the merged limma/edger/deseq/basic tables, and b) A summary of how many genes were observed as up/down by output table.

See Also

data.table openxlsx

Description

Where compare_led_tables looks for changes between limma and friends, this function looks for differences/similarities across the models/surrogates/etc across invocations of limma/deseq/edger.

Usage

```
compare_de_results(first, second, cor_method = "pearson",
  try_methods = c("limma", "deseq", "edger", "ebseq", "basic"))
```

Arguments

first One invocation of combine_de_tables to examine.

second A second invocation of combine de tables to examine.

cor_method Method to use for cor.test().

try_methods List of methods to attempt comparing.

Details

Tested in 29de_shared.R

44 compare_go_searches

Value

A list of compared columns, tables, and methods.

Examples

```
## Not run:
    first <- all_pairwise(expt, model_batch=FALSE, excel="first.xlsx")
    second <- all_pairwise(expt, model_batch="svaseq", excel="second.xlsx")
    comparison <- compare_de_results(first$combined, second$combined)
## End(Not run)</pre>
```

compare_go_searches

Compare the results from different ontology tools

Description

Combine the results from goseq, cluster profiler, topgo, and gostats; poke at them with a stick and see what happens. The general idea is to pull the p-value data from each tool and contrast that to the set of all possibile ontologies. This allows one to do a correlation coefficient between them. In addition, take the 1-pvalue for each ontology for each tool. Thus for strong p-values the score will be near 1 and so we can sum the scores for all the tools. Since topgo has 4 tools, the total possible is 7 if everything has a p-value equal to 0.

Usage

```
compare_go_searches(goseq = NULL, cluster = NULL, topgo = NULL,
  gostats = NULL)
```

Arguments

goseq The goseq result from simple_goseq()
cluster The result from simple_clusterprofiler()

topgo Guess gostats Yep, ditto

Value

a summary of the similarities of ontology searches

See Also

goseq clusterProfiler topGO goStats

compare_logfc_plots 45

compare_logfc_plots

Compare logFC values from limma and friends

Description

There are some peculiar discrepencies among these tools, what is up with that?

Usage

```
compare_logfc_plots(combined_tables)
```

Arguments

```
combined_tables
```

The combined tables from limma et al.

Details

Invoked by combine_de_tables() in order to compare the results.

Value

Some plots

See Also

```
plot_linear_scatter
```

Examples

```
## Not run:
limma_vs_deseq_vs_edger <- compare_logfc_plots(combined)
## Get a list of plots of logFC by contrast of LvD, LvE, DvE
## It provides comparisons against the basic analysis, but who cares about that.
## End(Not run)</pre>
```

```
compare_significant_contrasts
```

Implement a cleaner version of 'subset_significants' from analyses with Maria Adelaida.

Description

This should provide nice venn diagrams and some statistics to compare 2 or 3 contrasts in a differential expression analysis.

Usage

```
compare_significant_contrasts(sig_tables, compare_by = "deseq",
  weights = FALSE, contrasts = c(1, 2, 3))
```

Arguments

sig_tables A set of significance tables to poke at.

compare_by Use which program for the comparisons?

weights When printing venn diagrams, weight them?

contrasts A list of contrasts to compare.

```
compare_surrogate_estimates
```

Perform a comparison of the surrogate estimators demonstrated by Jeff Leek.

Description

This is entirely derivative, but seeks to provide similar estimates for one's own actual data and catch corner cases not taken into account in that document (for example if the estimators don't converge on a surrogate variable). This will attempt each of the surrogate estimators described by Leek: pca, sva supervised, sva unsupervised, ruv supervised, ruv residuals, ruv empirical. Upon completion it will perform the same limma expression analysis and plot the ranked t statistics as well as a correlation plot making use of the extracted estimators against condition/batch/whatever else. Finally, it does the same ranking plot against a linear fitting Leek performed and returns the whole pile of information as a list.

Usage

```
compare_surrogate_estimates(expt, extra_factors = NULL,
  filter_it = TRUE, filter_type = TRUE, do_catplots = FALSE,
  surrogates = "be", ...)
```

concatenate_runs 47

Arguments

expt	Experiment containing a design and other information.
extra_factors	Character list of extra factors which may be included in the final plot of the data.
filter_it	Most of the time these surrogate methods get mad if there are 0s in the data. Filter it?
filter_type	Type of filter to use when filtering the input data.
do_catplots	Include the catplots? They don't make a lot of sense yet, so probably no.
surrogates	Use 'be' or 'leek' surrogate estimates, or choose a number.
	Extra arguments when filtering.

Value

List of the results.

See Also

```
get_model_adjust
```

tion/batch.	concatenate_runs	Sum the reads/gene for multiple sequencing runs of a single condition/batch.
-------------	------------------	--

Description

On occasion we have multiple technical replicates of a sequencing run. This can use a column in the experimental design to identify those replicates and sum the counts into a single column in the count tables.

Usage

```
concatenate_runs(expt, column = "replicate")
```

Arguments

expt Experiment class containing the requisite metadata and count tables.

column Column of the design matrix used to specify which samples are replicates.

Details

Untested as of 2016-12-01, but used in a couple of projects where sequencing runs got repeated.

Value

Expt with the concatenated counts, new design matrix, batches, conditions, etc.

48 convert_counts

See Also

```
Biobase exprs fData pData
```

Examples

```
## Not run:
  compressed <- concatenate_runs(expt)
## End(Not run)</pre>
```

convert_counts

Perform a cpm/rpkm/whatever transformation of a count table.

Description

I should probably tell it to also handle a simple df/vector/list of gene lengths, but I haven't. cp_seq_m is a cpm conversion of the data followed by a rp-ish conversion which normalizes by the number of the given oligo. By default this oligo is 'TA' because it was used for tnseq which should be normalized by the number of possible transposition sites by mariner. It could, however, be used to normalize by the number of methionines, for example – if one wanted to do such a thing.

Usage

```
convert_counts(data, convert = "raw", ...)
```

Arguments

data Matrix of count data.

convert Type of conversion to perform: edgecpm/cpm/rpkm/cp_seq_m.

... Options I might pass from other functions are dropped into arglist, used by rpkm

(gene lengths) and divide_seq (genome, pattern to match, and annotation type).

Value

Dataframe of cpm/rpkm/whatever(counts)

See Also

```
edgeR Biobase cpm
```

Examples

```
## Not run:
  converted_table = convert_counts(count_table, convert='cbcbcpm')
## End(Not run)
```

convert_gsc_ids 49

Description

This is intended to convert all the IDs in a geneSet from one ID type to another and giving back the geneSet with the new IDs.

Usage

```
convert_gsc_ids(gsc, orgdb = "org.Hs.eg.db", from_type = NULL,
  to_type = "ENTREZID")
```

Arguments

gsc geneSetCollection with IDs of a type one wishes to change.

orgdb Annotation object containing the various IDs.

from_type Name of the ID which your gsc is using. This can probably be automagically

detected...

to_type Name of the ID you wish to use.

Details

One caveat: this will collapse redundant IDs via unique().

Value

Fresh gene set collection replete with new names.

cordist	Similarity measure which combines elements from Pearson correlation and Euclidean distance.
	ana Euctaean aistance.

Description

Here is Keith's summary: Where the cor returns the Pearson correlation matrix for the input matrix, and the dist function returns the Euclidean distance matrix for the input matrix. The LHS of the equation is simply the sign of the correlation function, which serves to preserve the sign of the interaction. The RHS combines the Pearson correlation and the log inverse Euclidean distance with equal weights. The result is a number in the range from -1 to 1 where values close to -1 indicate a strong negative correlation and values close to 1 indicate a strong positive correlation. While the Pearson correlation and Euclidean distance each contribute equally in the above equation, one could also assign tuning parameters to each of the metrics to allow for unequal contributions.

50 correlate_de_tables

Usage

```
cordist(data, cor_method = "pearson", dist_method = "euclidean",
  cor_weight = 0.5, ...)
```

Arguments

data Matrix of data

cor_method Which correlation method to use?
dist_method Which distance method to use?

cor_weight 0-1 weight of the correlation, the distance weight will be 1-cor_weight.

... extra arguments for cor/dist

Author(s)

Keigth Hughitt

correlate_de_tables

See how similar are results from limma/deseq/edger/ebseq.

Description

limma, DEseq2, and EdgeR all make somewhat different assumptions. and choices about what makes a meaningful set of differentially. expressed genes. This seeks to provide a quick and dirty metric describing the degree to which they (dis)agree.

Usage

```
correlate_de_tables(results, annot_df = NULL)
```

Arguments

results Data from do_pairwise()
annot_df Include annotation data?

... More options!

Details

Invoked by all_pairwise().

Value

Heatmap showing how similar they are along with some correlations betwee the three players.

See Also

limma_pairwise edger_pairwise deseq2_pairwise

counts_from_surrogates 51

Examples

```
## Not run:
l = limma_pairwise(expt)
d = deseq_pairwise(expt)
e = edger_pairwise(expt)
fun = compare_led_tables(limma=1, deseq=d, edger=e)
## End(Not run)
```

 ${\tt counts_from_surrogates}$

A single place to extract count tables from a set of surrogate variables.

Description

Given an initial set of counts and a series of surrogates, what would the resulting count table look like? Hopefully this function answers that question.

Usage

```
counts_from_surrogates(data, adjust = NULL, design = NULL,
  method = "ruv", cond_column = "condition", matrix_scale = "linear",
  return_scale = "linear", ...)
```

Arguments

data	Original count table, may be an expt/expressionset or df/matrix.
adjust	Surrogates with which to adjust the data.
design	Experimental design if it is not included in the expressionset.
method	Which methodology to follow, ideally these agree but that seems untrue.
cond_column	design column containing the condition data.
matrix_scale	Was the input for the surrogate estimator on a log or linear scale?
return_scale	Does one want the output linear or log?
	Arguments passed to downstream functions.

Value

A data frame of adjusted counts.

See Also

```
sva RUVSeq
```

52 count_nmer

count_expt_snps

Gather snp information for an expt

Description

This function attempts to gather a set of variant positions using an extant expressionset. This therefore seeks to keep the sample metadata consistent with the original data. In its current iteration, it therefore makes some potentially bad assumptions about the naming conventions for its input files. It furthermore assumes inputs from the variant calling methods in cyoa.

Usage

```
count_expt_snps(expt, type = "counts",
  input_dir = "preprocessing/outputs", tolower = TRUE)
```

Arguments

expt an expressionset from which to extract information.

type Use counts / samples or ratios?

input_dir Directory to scan for snps output files.

tolower Lowercase stuff like 'HPGL'?

Value

A new expt object

count_nmer

Count n-mers in a given data set using Biostrings

Description

This just calls PDict() and vcountPDict() on a sequence database given a pattern and number of mismatches. This may be used by divide_seq() normalization.

Usage

```
count_nmer(genome, pattern = "ATG", mismatch = 0)
```

Arguments

genome Sequence database, genome in this case.

pattern Count off this string.

mismatch How many mismatches are acceptable?

Value

Set of counts by sequence.

cp_options 53

cp_options	Set up appropriate option sets for clusterProfiler	

Description

This hard-sets some defaults for orgdb/kegg databases when using clusterProfiler.

Usage

```
cp_options(species)
```

Arguments

species Currently it only works for humans and fruit flies.

create_expt Wrap bioconductor's expressionset to include some other extraneous information.

Description

It is worth noting that this function has a lot of logic used to find the count tables in the local filesystem. This logic has been superceded by simply adding a field to the .csv file called 'file'. create_expt() will then just read that filename, it may be a full pathname or local to the cwd of the project.

Usage

```
create_expt(metadata = NULL, gene_info = NULL,
  count_dataframe = NULL, sample_colors = NULL, title = NULL,
  notes = NULL, include_type = "all", include_gff = NULL,
  file_column = "file", savefile = "expt", low_files = FALSE, ...)
```

Arguments

metadata	Comma separated file (or excel) describing the samples with information like condition, batch, count_filename, etc.	
gene_info	Annotation information describing the rows of the data set, this often comes from a call to import.gff() or biomart or organismdbi.	
count_dataframe		
	If one does not wish to read the count tables from the filesystem, they may instead be fed as a data frame here.	
sample_colors	List of colors by condition, if not provided it will generate its own colors using colorBrewer.	

54 default_norm

notes Additional notes?

I have usually assumed that all gff annotations should be used, but that is not always true, this allows one to limit to a specific annotation type.

Include_gff Gff file to help in sorting which features to keep.

Column to use in a gene information dataframe for savefile Rdata filename prefix for saving the data of the resulting expt.

Low_files Explicitly lowercase the filenames when searching the filesystem?

... More parameters are fun!

Value

experiment an expressionset

See Also

Biobase pData fData exprs read_counts_expt

Examples

```
## Not run:
    new_experiment <- create_expt("some_csv_file.csv", gene_info=gene_df)
    ## Remember that this depends on an existing data structure of gene annotations.
## End(Not run)</pre>
```

default_norm

Perform a default normalization of some data

Description

This just calls normalize expt with the most common arguments except log2 transformation, but that may be appended with 'transform=log2', so I don't feel bad. Indeed, it will allow you to overwrite any arguments if you wish. In our work, the most common normalization is: quantile(cpm(low-filter(data))).

Usage

```
default_norm(expt, ...)
```

Arguments

expt An expressionset containing expt object
... More options to pass to normalize_expt()

deparse_go_value 55

Value

The normalized expt

See Also

```
normalize_expt
```

deparse_go_value

Extract more easily readable information from a GOTERM datum.

Description

The output from the GOTERM/GO.db functions is inconsistent, to put it nicely. This attempts to extract from that heterogeneous datatype something easily readable. Example: Synonym() might return any of the following: NA, NULL, "NA", "NULL", c("NA",NA,"GO:00001"), "GO:00002", c("Some text",NA, NULL, "GO:00003") This function will boil that down to 'not found', ", 'GO:00004', or "GO:0001, some text, GO:00004"

Usage

```
deparse_go_value(value)
```

Arguments

value

Result of try(as.character(somefunction(GOTERM[id])), silent=TRUE). somefunction would be 'Synonym' 'Secondary' 'Ontology', etc...

Value

something more sane (hopefully).

See Also

GO.db

Examples

```
## Not run:
    ## goterms = GOTERM[ids]
    ## sane_goterms = deparse_go_value(goterms)
## End(Not run)
```

56 deseq2_pairwise

deseq2_pairwise	Set up model matrices contrasts and do pairwise comparisons of all conditions using DESeq2.

Description

Invoking DESeq2 is confusing, this should help.

Usage

```
deseq2_pairwise(input = NULL, conditions = NULL, batches = NULL,
  model_cond = TRUE, model_batch = TRUE, model_intercept = FALSE,
  alt_model = NULL, extra_contrasts = NULL, annot_df = NULL,
  force = FALSE, deseq_method = "long", ...)
```

Arguments

input Dataframe/vector or expt class containing data, normalization state, etc.

conditions Factor of conditions in the experiment.

batches Factor of batches in the experiment.

model_cond Is condition in the experimental model?

model_batch Is batch in the experimental model?

model_intercept

Use an intercept model?

alt_model Provide an arbitrary model here.

extra_contrasts

Provide extra contrasts here.

annot_df Include some annotation information in the results?

force Force deseq to accept data which likely violates its assumptions.

deseq_method The DESeq2 manual shows a few ways to invoke it, I make 2 of them available

here.

... Triple dots! Options are passed to arglist.

Details

Tested in test_24de_deseq.R Like the other _pairwise() functions, this attempts to perform all pairwise contrasts in the provided data set. The details are of course slightly different when using DESeq2. Thus, this uses the function choose_binom_dataset() to try to ensure that the incoming data is appropriate for DESeq2 (if one normalized the data, it will attempt to revert to raw counts, for example). It continues on to extract the conditions and batches in the data, choose an appropriate experimental model, and run the DESeq analyses as described in the manual. It defaults to using an experimental batch factor, but will accept a string like 'sva' instead, in which case it will use sva to estimate the surrogates, and append them to the experimental design. The deseq_method parameter may be used to apply different DESeq2 code paths as outlined in the manual. If you want to play with non-standard data, the force argument will round the data and shoe-horn it into DESeq2.

deseq_pairwise 57

Value

List including the following information: run = the return from calling DESeq() denominators = list of denominators in the contrasts numerators = list of the numerators in the contrasts conditions = the list of conditions in the experiment coefficients = list of coefficients making the contrasts all_tables = list of DE tables

See Also

DESeq2 Biobase stats

Examples

```
## Not run:
    pretend = deseq2_pairwise(data, conditions, batches)
## End(Not run)
```

deseq_pairwise

deseq_pairwise() Because I can't be trusted to remember '2'.

Description

This calls deseq2_pairwise(...) because I am determined to forget typing deseq2.

Usage

```
deseq_pairwise(...)
```

Arguments

... I like cats.

Value

stuff deseq2_pairwise results.

See Also

```
deseq2_pairwise
```

58 disjunct_pvalues

de_venn

Create venn diagrams describing how well deseq/limma/edger agree.

Description

The sets of genes provided by limma and friends would ideally always agree, but they do not. Use this to see out how much the (dis)agree.

Usage

```
de_venn(table, adjp = FALSE, p = 0.05, lfc = 0, ...)
```

Arguments

table	Which table to query?
adjp	Use adjusted p-values
p	p-value cutoff, I forget what for right now.
lfc	What fold-change cutoff to include?
	More arguments are passed to arglist.

Value

A list of venn plots

See Also

venneuler Vennerable

Examples

```
## Not run:
bunchovenns <- de_venn(pairwise_result)
## End(Not run)</pre>
```

disjunct_pvalues

Test for infected/control/beads – a placebo effect?

Description

The goal is therefore to find responses different than beads The null hypothesis is (H0): (infected == uninfected) || (infected == beads) The alt hypothesis is (HA): (infected != uninfected) && (infected != beads)

divide_seq 59

Usage

```
disjunct_pvalues(contrast_fit, cellmeans_fit, conj_contrasts,
   disj_contrast)
```

Arguments

```
contrast_fit     The result of lmFit.
cellmeans_fit     The result of a cellmeans fit.
conj_contrasts     The result from the makeContrasts of the first set.
disj_contrast     The result of the makeContrasts of the second set.
```

divide_seq

Express a data frame of counts as reads per pattern per million.

Description

This uses a sequence pattern rather than length to normalize sequence. It is essentially fancy pants rpkm.

Usage

```
divide_seq(counts, ...)
```

Arguments

counts Read count matrix.

... Options I might pass from other functions are dropped into arglist.

Value

The RPseqM counts

See Also

```
edgeR Rsamtools FaFile rpkm
```

Examples

```
## Not run:
  cptam <- divide_seq(cont_table, fasta="mgas_5005.fasta.xz", gff="mgas_5005.gff.xz")
## End(Not run)</pre>
```

download_gbk

download_eupath_metadata

Returns metadata for all eupathdb organisms.

Description

Returns metadata for all eupathdb organisms.

Usage

```
download_eupath_metadata(overwrite = FALSE, webservice = "eupathdb",
    dir = "eupathdb", use_savefile = TRUE, ...)
```

Arguments

overwrite Overwrite existing data?

webservice Optional alternative webservice for hard-to-find species.

dir Where to put the json.

use_savefile Make a savefile of the data for future reference.

... Catch any extra arguments passed here, currently unused.

Value

Dataframe with lots of rows for the various species in eupathdb.

Author(s)

Keith Hughitt

download_gbk

A genbank accession downloader scurrilously stolen from ape.

Description

This takes and downloads genbank accessions.

Usage

```
download_gbk(accessions = "AE009949", write = TRUE)
```

Arguments

accession – actually a set of them.

write Write the files? Otherwise return a list of the strings

Details

Tested in test_40ann_biomartgenbank.R In this function I stole the same functionality from the ape package and set a few defaults so that it hopefully fails less often.

Value

A list containing the number of files downloaded and the character strings acquired.

Author(s)

The ape authors with some modifications by atb.

See Also

ape

Examples

```
## Not run:
  gbk_file <- download_gbk(accessions="AE009949")
## End(Not run)</pre>
```

download_microbesonline_files

Download the various file formats from microbesoline.

Description

Microbesonline provides an interesting set of file formats to download. Each format proves useful under one condition or another, ergo this defaults to iterating through them all and getting every file.

Usage

```
download_microbesonline_files(id = "160490", type = NULL)
```

Arguments

id Species ID to query.

type File type(s) to download, if left null it will grab the genbank, tab, protein fasta,

transcript fasta, and genome.

Value

List describing the files downloaded and their locations.

Author(s)

atb

do_pairwise

download_uniprot_proteome

Download the txt uniprot data for a given accession/species

Description

Download the txt uniprot data for a given accession/species

Usage

```
download_uniprot_proteome(accession = NULL, species = NULL,
    all = FALSE, first = FALSE)
```

Arguments

accession Which accession to grab? species Or perhaps species?

all If there are more than 1 hit, grab them all?

first Or perhaps just grab the first hit?

Value

A filename/accession tuple.

do_pairwise

Generalize pairwise comparisons

Description

I want to multithread my pairwise comparisons, this is the first step in doing so.

Usage

```
do_pairwise(type, ...)
```

Arguments

type Which type of pairwise comparison to perform

... The set of arguments intended for limma_pairwise(), edger_pairwise(), and friends.

Details

Used to make parallel operations easier.

do_topgo 63

Value

The result from limma/deseq/edger/basic

See Also

limma_pairwise edger_pairwise deseq_pairwise basic_pairwise

Description

My function 'simple_topgo()' was excessively long and a morass of copy/pasted fragments. This attempts to simplify that and converge on a single piece of code for all the methodologies provided by topgo.

Usage

```
do_topgo(type, go_map = NULL, fisher_genes = NULL, ks_genes = NULL,
    selector = "topDiffGenes", sigforall = TRUE, numchar = 300,
    pval_column = "adj.P.Val", overwrite = FALSE, cutoff = 0.05,
    densities = FALSE, pval_plots = TRUE)
```

Arguments

type	Type of topgo search to perform: fisher, KS, EL, or weight.
go_map	Mappings of gene and GO IDs.
fisher_genes	List of genes used for fisher analyses.
ks_genes	List of genes used for KS analyses.
selector	Function to use when selecting genes.
sigforall	Provide significance metrics for all ontologies observed, not only the ones deemed statistically significant.
numchar	A limit on characters printed when printing topgo tables (used?)
pval_column	Column from which to extract DE p-values.
overwrite	Overwrite an existing gene ID/GO mapping?
cutoff	Define 'significant'?
densities	Perform gene density plots by ontology?
pval_plots	Print p-values plots as per clusterProfiler?

Value

A list of results from the various tests in topGO.

64 ebseq_pairwise

ebseq_pairwise	Set up model matrices contrasts and do pairwise comparisons of all conditions using EBSeq.

Description

Invoking EBSeq is confusing, this should help.

Usage

```
ebseq_pairwise(input = NULL, patterns = NULL, conditions = NULL,
batches = NULL, model_cond = NULL, model_intercept = NULL,
alt_model = NULL, model_batch = NULL, ng_vector = NULL,
rounds = 10, target_fdr = 0.05, method = "pairwise_subset",
norm = "median", ...)
```

Arguments

input	Dataframe/vector or expt class containing data, normalization state, etc.
patterns	Set of expression patterns to query.
conditions	Not currently used, but passed from all_pairwise()
batches	Not currently used, but passed from all_pairwise()
model_cond	Not currently used, but passed from all_pairwise()
model_intercep	t
	Not currently used, but passed from all_pairwise()
alt_model	Not currently used, but passed from all_pairwise()
model_batch	Not currently used, but passed from all_pairwise()
ng_vector	I think this is for isoform quantification, but am not yet certain.
rounds	Number of iterations for doing the multi-test
target_fdr	Definition of 'significant'
method	The default ebseq methodology is to create the set of all possible 'patterns' in the data; for data sets which are more than trivially complex, this is not tenable, so this defaults to subsetting the data into pairs of conditions.
norm	Normalization method to use.
	Extra arguments currently unused.

edger_pairwise 65

edger_pairwise	Set up a model matrix and set of contrasts to do pairwise comparisons using EdgeR.
	20,000

Description

This function performs the set of possible pairwise comparisons using EdgeR.

Usage

```
edger_pairwise(input = NULL, conditions = NULL, batches = NULL,
  model_cond = TRUE, model_batch = TRUE, model_intercept = FALSE,
  alt_model = NULL, extra_contrasts = NULL, annot_df = NULL,
  force = FALSE, edger_method = "long", ...)
```

Arguments

input Dataframe/vector or expt class containing data, normalization state, etc.

conditions Factor of conditions in the experiment.

batches Factor of batches in the experiment.

model_batch Include batch in the model? In most cases this is a good thing(tm).

model_intercept

Use an intercept containing model?

alt_model Alternate experimental model to use?

extra_contrasts

Add some extra contrasts to add to the list of pairwise contrasts. This can be pretty neat, lets say one has conditions A,B,C,D,E and wants to do (C/B)/A and (E/D)/A or (E/D)/(C/B) then use this with a string like: "c_vs_b_ctrla = (C-B)-

A, $e_{vs_d} = (E-D)-A$, $de_{vs_c} = (E-D)-(C-B)$,"

annot_df Annotation information to the data tables?

force Force edgeR to accept inputs which it should not have to deal with.

edger_method I found a couple/few ways of doing edger in the manual, choose with this.

... The elipsis parameter is fed to write_edger() at the end.

Details

Tested in test_26de_edger.R Like the other _pairwise() functions, this attempts to perform all pairwise contrasts in the provided data set. The details are of course slightly different when using EdgeR. Thus, this uses the function choose_binom_dataset() to try to ensure that the incoming data is appropriate for EdgeR (if one normalized the data, it will attempt to revert to raw counts, for example). It continues on to extract the conditions and batches in the data, choose an appropriate experimental model, and run the EdgeR analyses as described in the manual. It defaults to using an experimental batch factor, but will accept a string like 'sva' instead, in which case it will use sva to

66 exclude_genes_expt

estimate the surrogates, and append them to the experimental design. The edger_method parameter may be used to apply different EdgeR code paths as outlined in the manual. If you want to play with non-standard data, the force argument will round the data and shoe-horn it into EdgeR.

Value

List including the following information: contrasts = The string representation of the contrasts performed. lrt = A list of the results from calling glmLRT(), one for each contrast. contrast_list = The list of each call to makeContrasts() I do this to avoid running into the limit on # of contrasts addressable by topTags() all_tables = a list of tables for the contrasts performed.

See Also

edgeR

Examples

```
## Not run:
    pretend = edger_pairwise(data, conditions, batches)
## End(Not run)
```

exclude_genes_expt

Exclude some genes given a pattern match

Description

Because I am too lazy to remember that expressionsets use matrix subsets for gene and sample. Also those methods lead to shenanigans when I want to know what happened to the data over the course of the subset.

Usage

```
exclude_genes_expt(expt, column = "txtype", method = "remove",
ids = NULL, patterns = c("snRNA", "tRNA", "rRNA"), ...)
```

Arguments

expt Expressionset containing expt object. column fData column to use for subsetting.

method Either remove explicit rows, or keep them.

ids Specific IDs to exclude.

patterns Character list of patterns to remove/keep

... Extra arguments are passed to arglist, currently unused.

Value

A smaller expt

expt 67

See Also

```
create_expt
```

expt

An expt is an ExpressionSet superclass with a shorter name.

Description

It is also a simple list so that one may summarize it more simply, provides colors and some slots to make one's life easier. It is created via the function create_expt() which perhaps should be changed.

Usage

```
expt(...)
```

Arguments

... Parameters for create_expt()

Details

Another important caveat: expressionSets and their methods are all S4; but I did not want to write S4 methods, so I made my expt a S3 class. As a result, in order to make use of exprs, notes, pData, fData, and friends, I made use of setMethod() to set up calls for the expressionSet portion of the expt objects.

Slots

```
original_expressionset Copy of the original expressionSet.

original_metadata Copy of the original experimental design.

title Title for the expressionSet.

notes Notes for the expressionSet (redundant with S4 notes()).

design Copy of the experimental metadata (redundant with pData()).

annotation Gene annotations (redundant with fData()).

gff_file filename of a gff file which feeds this data.

state What is the state of the data vis a vis normalization, conversion, etc.

conditions Usually the condition column from pData.

batches Usually the batch column from pData.

original_metadata Experimental metadata before messing with it.

original_libsize Library sizes of samples before messing with them.

libsize Library sizes of the data in its current state.

colors Chosen colors for plotting the data.

tximport Data provided by tximport() to create the exprs() data.
```

```
extract_abundant_genes
```

Extract the sets of genes which are significantly more abundant than the rest.

Description

Given the output of something_pairwise(), pull out the genes for each contrast which are the most/least abundant. This is in contrast to extract_significant_genes(). That function seeks out the most changed, statistically significant genes.

Usage

```
extract_abundant_genes(pairwise, according_to = "all", n = 200,
  z = NULL, unique = FALSE, least = FALSE,
  excel = "excel/abundant_genes.xlsx", ...)
```

Arguments

pairwise	Output from _pairwise()().
according_to	What tool(s) define 'most?' One may use deseq, edger, limma, basic, all.
n	How many genes to pull?
z	Instead take the distribution of abundances and pull those past the given z score.
unique	One might want the subset of unique genes in the top-n which are unique in the set of available conditions. This will attempt to provide that.
least	Instead of the most abundant, do the least.
excel	Excel file to write.
	Arguments passed into arglist.

Value

The set of most/least abundant genes by contrast/tool.

See Also

openxlsx

```
extract_coefficient_scatter
```

Perform a coefficient scatter plot of a limma/deseq/edger/basic table.

Description

Plot the gene abundances for two coefficients in a differential expression comparison. By default, genes past 1.5 z scores from the mean are colored red/green.

Usage

```
extract_coefficient_scatter(output, toptable = NULL, type = "limma",
  x = 1, y = 2, z = 1.5, p = NULL, lfc = NULL, n = NULL,
  loess = FALSE, alpha = 0.4, color_low = "#DD0000",
  z_lines = FALSE, color_high = "#7B9F35", ...)
```

Arguments

output	Result from the de_ family of functions, all_pairwise, or combine_de_tables().
toptable	Chosen table to query for abundances.
type	Query limma, deseq, edger, or basic outputs.
x	The x-axis column to use, either a number of name.
У	The y-axis column to use.
Z	Define the range of genes to color (FIXME: extend this to p-value and fold-change).
р	Set a p-value cutoff for coloring the scatter plot (currently not supported).
lfc	Set a fold-change cutoff for coloring points in the scatter plot (currently not supported.)
n	Set a top-n fold-change for coloring the points in the scatter plot (this should work, actually).
loess	Add a loess estimation (This is slow.)
alpha	How see-through to make the dots.
color_low	Color for the genes less than the mean.
z_lines	Add lines to show the z-score demarcations.
color_high	Color for the genes greater than the mean.
	More arguments are passed to arglist.

See Also

```
ggplot2 plot_linear_scatter
```

70 extract_de_plots

Examples

extract_de_plots

Make a MA plot of some limma output with pretty colors and shapes

Description

Yay pretty colors and shapes!

Usage

```
extract_de_plots(pairwise, type = "edger", table = NULL, logfc = 1,
    p_type = "adj", p = 0.05, invert = FALSE, ...)
```

Arguments

pairwise The result from all_pairwise(), which should be changed to handle other invo-

cations too.

type Type of table to use: deseq, edger, limma, basic.

table Result from edger to use, left alone it chooses the first.

logfc What logFC to use for the MA plot horizontal lines.

p Cutoff to define 'significant' by p-value.

invert Invert the plot?

... Extra arguments are passed to arglist.

Value

a plot!

See Also

```
plot_ma_de
```

Examples

```
## Not run:
prettyplot <- edger_ma(all_aprwise) ## [sic, I'm witty! and can speel]
## End(Not run)</pre>
```

```
extract_eupath_orthologs
```

Given 2 species names from the eupathdb, make orthology tables betwixt them.

Description

The eupathdb provides such a tremendous wealth of information. For me though, it is difficult sometimes to boil it down into just the bits of comparison I want for 1 species or between 2 species. A singularly common question I am asked is: "What are the most similar genes between species x and y among these two arbitrary parasites?" There are lots of ways to poke at this question: run BLAST/fasta36, use biomart, query the ortholog tables from the eupathdb, etc. However, in all these cases, it is not trivial to ask the next question: What about: a:b and b:a? This function attempts to address that for the case of two eupath species from the same domain. (tritrypdb/fungidb/etc.) It does however assume that the sqlite package has been installed locally, if not it suggests you run the make_organismdbi function in order to do that.

Usage

```
extract_eupath_orthologs(db, master = "GID", query_species = NULL,
id_column = "ORTHOLOG_ID", org_column = "ORGANISM",
url_column = "ORTHOLOG_GROUP", count_column = "ORTHOLOG_COUNT",
print_speciesnames = FALSE)
```

Arguments

db

master Primary keytype to use for indexing the various tables.

query_species A list of exact species names to search for. If uncertain about them, add print_speciesnames=TRUE

and be ready for a big blob of text. If left null, then it will pull all species.

id_column What column in the database provides the set of ortholog IDs?

Species name (subset) from one eupath database.

org_column What column provides the species name?

url_column What column provides the orthomcl group ID?

count_column Name of the column with the count of species represented.

print_speciesnames

Dump the species names for diagnostics?

Details

One other important caveat: this function assumes queries in the format 'table_column' where in this particular instance, the table is further assumed to be the ortholog table.

Value

A big table of orthoMCL families, the columns are:

- 1. GID: The gene ID
- 2. ORTHOLOG_ID: The gene ID of the associated ortholog.
- 3. ORTHOLOG_SPECIES: The species of the associated ortholog.
- 4. ORTHOLOG_URL: The OrthoMCL group ID's URL.
- 5. ORTHOLOG_COUNT: The number of all genes from all species represented in this group.
- 6. ORTHOLOG_GROUP: The family ID
- 7. QUERIES_IN_GROUP: How many of the query species are represented in this group?
- 8. GROUP_REPRESENTATION: ORTHOLOG_COUNT / the number of possible species.

Author(s)

atb

```
extract_gene_locations
```

Clean up the gene location field from eupathdb derived gene location data.

Description

The eupathdb encodes its location data for genes in a somewhat peculiar format: chromosome:start..end(strand), but I would prefer to have these snippets of information as separate columns so that I can do things like trivially perform rpkm().

Usage

```
extract_gene_locations(annot_df,
  location_column = "annot_gene_location_text")
```

Arguments

```
annot_df Data frame resulting from load_orgdb_annotations() location_column
```

Name of the column to extract the start/end/length/etc from.

Value

Somewhat nicer data frame.

Author(s)

atb

extract_go 73

Δvtr	act.	$\alpha \cap$
CALI	act.	_50

Extract a set of geneID to GOID mappings from a suitable data source.

Description

Like extract_lengths above, this is primarily intended to read gene ID and GO ID mappings from a OrgDb/OrganismDbi object.

Usage

```
extract_go(db, metadf = NULL, keytype = "ENTREZID")
```

Arguments

db Data source containing mapping information.

metadf Data frame containing extant information.

keytype used for querying

Value

Dataframe of 2 columns: geneID and goID.

See Also

AnnotationDbi

extract_lengths	Take	gene/exon	lengths	from	a	suitable	data	source
	(gff/Tx	:Db/Organisn	nDbi)					

Description

Primarily goseq, but also other tools on occasion require a set of gene IDs and lengths. This function is resposible for pulling that data from either a gff, or TxDb/OrganismDbi.

Usage

```
extract_lengths(db = NULL, gene_list = NULL,
  type = "GenomicFeatures::transcripts", id = "TXID",
  possible_types = c("GenomicFeatures::genes", "GenomicFeatures::cds",
  "GenomicFeatures::transcripts"), ...)
```

74 extract_metadata

Arguments

db Object containing data, if it is a string then a filename is assumed to a gff file.

gene_list Set of genes to query.

type Function name used for extracting data from TxDb objects.id Column from the resulting data structure to extract gene IDs.

possible_types Character list of types I have previously used.

... More arguments are passed to arglist.

Value

Dataframe containing 2 columns: ID, length

See Also

GenomicFeatures

extract_metadata

Pull metadata from a table (xlsx/xls/csv/whatever)

Description

Pull metadata from a table (xlsx/xls/csv/whatever)

Usage

```
extract_metadata(metadata, ...)
```

Arguments

metadata file or df of metadata

. . . Arguments to pass to the child functions.

Value

Metadata dataframe hopefully cleaned up to not be obnoxious.

extract_mzxml_data 75

extract_mzxml_data Read a bunch of mzXML files to acquire their metadata.

Description

I have had difficulties getting the full set of correct parameters for a DDA/DIA experiment. After some poking, I eventually found most of these required prameters in the mzXML raw files. Ergo, this function uses them.

Usage

```
extract_mzxml_data(metadata, write_windows = TRUE,
  id_column = "sampleid", parallel = TRUE, savefile = NULL, ...)
```

Arguments

metadata	Data frame describing the samples, including the mzXML filenames.
write_windows	Write out SWATH window frames.
id_column	What column in the sample sheet provides the ID for the samples?
parallel	Perform operations using an R foreach cluster?
savefile	If not null, save the resulting data structure to an rda file.
•••	Extra arguments, presumably color palettes and column names and stuff like that.

Value

A list of data extracted from every sample in the MS run (DIA or DDA).

```
extract_peprophet_data
```

Get some data from a peptideprophet run. I am not sure what if any parameters this should have, but it seeks to extract the useful data from a peptide prophet run. In the situation in which I wish to use it, the input command was: > xinteract -dDECOY_ -OARPpd -Nfdr_library.xml comet_result.pep.xml Eg. It is a peptideprophet result provided by TPP. I want to read the resulting xml table and turn it into a data.table so that I can plot some metrics from it.

Description

Get some data from a peptideprophet run. I am not sure what if any parameters this should have, but it seeks to extract the useful data from a peptide prophet run. In the situation in which I wish to use it, the input command was: > xinteract -dDECOY_ -OARPpd -Nfdr_library.xml comet_result.pep.xml Eg. It is a peptideprophet result provided by TPP. I want to read the resulting xml table and turn it into a data.table so that I can plot some metrics from it.

Usage

```
extract_peprophet_data(pepxml, decoy_string = "DECOY_", ...)
```

Arguments

pepxml The file resulting from the xinteract invocation.

decoy_string What prefix do decoys have in the data.

... Catch extra arguments passed here, currently unused.

Value

data table of all the information I saw fit to extract The columns are: * protein: The name of the matching sequence (DECOYs allowed here) * decoy: TRUE/FALSE, is this one of our decoys? * peptide: The sequence of the matching spectrum. * start_scan: The scan in which this peptide was observed * end scan: Ibid * index This seems to just increment * precursor_neutral_mass: Calculated mass of this fragment assuming no isotope shenanigans (yeah, looking at you C13). * assumed_charge: The expected charge state of this peptide. * retention_time_sec: The time at which this peptide eluted during the run. * peptide prev aa: The amino acid before the match. * peptide next aa: and the following amino acid. * num tot proteins: The number of matches not counting decoys. * num_matched_ions: How many ions for this peptide matched? * tot_num_ions: How many theoretical ions are in this fragment? * matched ion ratio: num matched ions / tot num ions, bigger is better! * cal neutral pep mass: This is redundant with precursor neutral mass, but recalculated by peptideProphet, so if there is a discrepency we should yell at someone! * massdiff How far off is the observed mass vs. the calculated? (also redundant with massd later) * num_tol_term: The number of peptide termini which are consistent with the cleavage (hopefully 2), but potentially 1 or even 0 if digestion was bad. (redundant with ntt later) * num_missed_cleavages: How many cleavages must have failed in order for this to be a good match? * num_matched_peptides: Number of alternate possible peptide matches. * xcorr: cross correlation of the experimental and theoretical spectra (this is supposedly only used by sequest, but I seem to have it here...) * deltacn: The normalized difference between the xcorr values for the best hit and next best hit. Thus higher numbers suggest better matches. * deltacnstar: Apparently 'important for things like phospho-searches containing homologous top-scoring peptides when analyzed by peptideprophet...' – the comet release notes. * spscore: The raw value of preliminary score from the sequest algorithm. * sprank: The rank of the match in a preliminary score. 1 is good. * expect: E-value of the given peptide hit. Thus how many identifications one expect to observe by chance, lower is therefore better * prophet probability: The peptide prophet probability score, higher is better. * fval: 0.6(the dot function + 0.4(the delta dot function) - (the dot bias penalty function) - which is to say... well I dunno, but it is supposed to provide information about how similar this match is to other potential matches, so I presume higher means the match is more ambiguous. * ntt: Redundant with num_tol_term above, but this time from peptide prophet. * nmc: Redundant with num_missed_cleavages, except it coalesces them. * massd: Redundant with massdiff * isomassd: The mass difference, but taking into account stupid C13. * RT: Retention time * RT_score: The score of the retention time! * modified_peptides: A string describing modifications in the found peptide * variable_mods: A comma separated list of the variable modifications observed. * static_mods: A comma separated list of the static modifications observed.

```
extract_pyprophet_data
```

Read a bunch of scored swath outputs from pyprophet to acquire their metrics.

Description

This function is mostly cribbed from the other extract_ functions in this file. With it, I hope to be able to provide some metrics of a set of openswath runs, thus potentially opening the door to being able to objectively compare the same run with different options and/or different runs.

Usage

```
extract_pyprophet_data(metadata, pyprophet_column = "diascored",
   savefile = NULL, ...)
```

Arguments

metadata Data frame describing the samples, including the mzXML filenames.

pyprophet_column

Which column from the metadata provides the requisite filenames?

savefile If not null, save the data from this to the given filename.

... Extra arguments, presumably color palettes and column names and stuff like

that.

Details

Likely columns generated by exporting OpenMS data via pyprophet include: transition_group_id: Incrementing ID of the transition in the MS(.pqp) library used for matching (I am pretty sure). decoy: Is this match of a decoy peptide? run id: This is a bizarre encoding of the run, OpenMS/pyprophet re-encodes the run ID from the filename to a large signed integer. filename: Which raw mzXML file provides this particular intensity value? rt: Retention time in seconds for the matching peak group. assay_rt: The expected retention time after normalization with the iRT. (how does the iRT change this value?) delta_rt: The difference between rt and assay_rt irt: (As described in the abstract of Claudia Escher's 2012 paper: "Here we present iRT, an empirically derived dimensionless peptide-specific value that allows for highly accurate RT prediction. The iRT of a peptide is a fixed number relative to a standard set of reference iRT-peptides that can be transferred across laboratories and chromatographic systems.") assay_irt: The iRT observed in the actual chromatographic run. delta_irt: The difference. I am seeing that all the delta iRTs are in the -4000 range for our actual experiment; since this is in seconds, does that mean that it is ok as long as they stay in a similar range? id: unique long signed integer for the peak group, sequence: The sequence of the matched peptide fullunimodpeptidename: The sequence, but with unimod formatted modifications included. charge: The assumed charge of the observed peptide. mz: The m/z value of the precursor ion. intensity: The sum of all transition intensities in the peak group. aggr_prec_peak_area: Semi-colon separated list of intensities (peak areas) of the MS traces for this match. aggr_prec_peak_apex: Intensity peak apexes of the MS1 traces. leftwidth: The start of the peak group in seconds. rightwidth: The end

78 extract_scan_data

of the peak group in seconds. peak_group_rank: When multiple peak groups match, which one is this? d_score: I think this is the score as retured by openMS (higher is better). m_score: I am pretty sure this is the result of a SELECT QVALUE operation in pyprophet. aggr_peak_area: The intensities of this fragment ion separated by semicolons. aggr_peak_apex: The intensities of this fragment ion separated by semicolons. aggr_fragment_annotation: Annotations of the fragment ion traces by semicolon. proteinname: Name of the matching protein. m_score_protein_run_specific: I am guessing the fdr for the pvalue for this run. mass: Mass of the observed fragment.

Value

A list of data from each sample in the pyprophet scored DIA run.

extract_scan_data

Read a mzXML file and extract from it some important metadata.

Description

When working with swath data, it is fundamentally important to know the correct values for a bunch of the input variables. These are not trivial to acquire. This function attempts to make this easier (but slow) by reading the mzXML file and parsing out helpful data.

Usage

```
extract_scan_data(file, id = NULL, write_acquisitions = TRUE)
```

Arguments

file Filename to read.

id An id to give the result.

write_acquisitions

If a filename is provided, write a tab separated table of windows.

Value

List containing a table of scan and precursor data.

extract_siggenes 79

extract_siggenes

Alias for extract_significant_genes because I am dumb.

Description

Alias for extract_significant_genes because I am dumb.

Usage

```
extract_siggenes(...)
```

Arguments

... The parameters for extract_significant_genes()

Value

It should return a reminder for me to remember my function names or change them to something not stupid.

```
extract_significant_genes
```

Extract the sets of genes which are significantly up/down regulated from the combined tables.

Description

Given the output from combine_de_tables(), extract the genes in which we have the greatest likely interest, either because they have the largest fold changes, lowest p-values, fall outside a z-score, or are at the top/bottom of the ranked list.

Usage

```
extract_significant_genes(combined, according_to = "all", lfc = 1,
    p = 0.05, sig_bar = TRUE, z = NULL, n = NULL, ma = TRUE,
    p_type = "adj", invert_barplots = FALSE,
    excel = "excel/significant_genes.xlsx", siglfc_cutoffs = c(0, 1, 2),
    ...)
```

80 factor_rsquared

Arguments

combined Output from combine_de_tables().

according_to What tool(s) decide 'significant?' One may use the deseq, edger, limma, basic,

meta, or all.

lfc Log fold change to define 'significant'.

p (Adjusted)p-value to define 'significant'.

sig_bar Add bar plots describing various cutoffs of 'significant'?

z Z-score to define 'significant'.n Take the top/bottom-n genes.

ma Add ma plots to the sheets of 'up' genes?

p_type use an adjusted p-value?

invert_barplots

Invert the significance barplots as per Najib's request?

excel Write the results to this excel file, or NULL.

siglfc_cutoffs Set of cutoffs used to define levels of 'significant.'

... Arguments passed into arglist.

Value

The set of up-genes, down-genes, and numbers therein.

See Also

combine_de_tables

factor_rsquared	Collect the r^2 values from a linear model fitting between a singular
	value decomposition and factor.

Description

Collect the r^2 values from a linear model fitting between a singular value decomposition and factor.

Usage

```
factor_rsquared(datum, fact, type = "factor")
```

Arguments

datum Result from corpcor::fast.svd.

fact Experimental factor from the original data.

type Make this categorical or continuous with factor/continuous.

features_greater_than 81

Value

The r² values of the linear model as a percentage.

See Also

```
corpcor fast.svd
```

features_greater_than Count the number of features(genes) greater than x in a data set.

Description

Sometimes I am asked how many genes have >= x counts. Well, here you go.

Usage

```
features_greater_than(data, cutoff = 1, hard = TRUE, inverse = FALSE)
```

Arguments

data Dataframe/exprs/matrix/whatever of counts.

cutoff Minimum number of counts.

hard Greater-than is hard, greater-than-equals is not.

inverse when inverted, this provides features less than the cutoff.

Details

Untested as of 2016-12-01 but used with Lucia. I think it would be interesting to iterate this function from small to large cutoffs and plot how the number of kept genes decreases.

Value

A list of two elements, the first comprised of the number of genes greater than the cutoff, the second with the identities of said genes.

See Also

Biobase

Examples

```
## Not run:
  features <- features_greater_than(expt)
## End(Not run)</pre>
```

82 features_less_than

```
features_in_single_condition
```

I want an easy way to answer the question: what features are in condition x but no others.

Description

The answer to this lies in a combination of subset_expt() and features_greater_than().

Usage

```
features_in_single_condition(expt, cutoff = 2)
```

Arguments

expt An experiment to query.

cutoff What is the minimum number of counts required to define 'included.'

Value

A set of features.

features_less_than

Do features_greater_than() inverted!

Description

Do features_greater_than() inverted!

Usage

```
features_less_than(...)
```

Arguments

... Arguments passed to features_greather_than()

Value

The set of features less than whatever you would have done with features_greater_than().

filter_counts 83

|--|

Description

This calls the various filtering functions in genefilter along with suggestions made in our lab meetings; defaulting to the threshold based filter suggested by Hector.

Usage

```
filter_counts(count_table, filter = "hpgl", p = 0.01, A = 1, k = 1, cv_min = 0.01, cv_max = 1000, thresh = 1, min_samples = 2, ...)
```

Arguments

count_table	Some counts to filter.
filter	Filtering method to apply (cbcb, pofa, kofa, cv right now).
p	Used by genefilter's pofa().
Α	Also for pofa().
k	Used by genefilter's kofa().
cv_min	Used by genefilter's cv().
cv_max	Also used by cv().
thresh	Minimum threshold across samples for cbcb.
min_samples	Minimum number of samples for cbcb.
	More options might be needed, especially if I fold cv/p/etc into

Value

Data frame of filtered counts.

See Also

genefilter

Examples

```
## Not run:
  new <- filter_counts(old)
## End(Not run)</pre>
```

84 gather_genes_orgdb

flanking_sequence Extract sequence flanking a set of annotations (generally coding sequences)	flanking_sequence	
---	-------------------	--

Description

Given a set of annotations and genome, one might want to get the set of adjacent sequences.

Usage

```
flanking_sequence(bsgenome, annotation, distance = 200, type = "gene",
    prefix = "")
```

Arguments

bsgenome Genome sequence annotation Set of annotations

distance How far from each annotation is desired? type What type of annotation is desired?

prefix Provide a prefix to the names to distinguish them from the existing annotations.

Value

A list of sequences before and after each sequence.

gather_genes_orgdb	Use the orgdb instances from clusterProfiler to gather annotation data for GO.
--------------------	--

Description

Since clusterprofiler no longer builds gomaps, I need to start understanding how to properly get information from orgDBs.

Usage

```
gather_genes_orgdb(goseq_data, orgdb_go, orgdb_ensembl)
```

Arguments

goseq_data Some data from goseq and friends.

orgdb_go The orgDb instance with GO data.

orgdb_ensembl The orgDb instance with ensembl data.

gather_ontology_genes 85

Value

a go mapping

See Also

clusterProfiler

gather_ontology_genes Given a set of goseq data from simple_goseq(), make a list of genes represented in each ontology.

Description

This function uses the GO2ALLEG data structure to reverse map ontology categories to a list of genes represented. It therefore assumes that the GO2ALLEG.rda data structure has been deposited in pwd(). This in turn may be generated by clusterProfilers buildGOmap() function if it doesn't exist. For some species it may also be auto-generated. With little work this can be made much more generic, and it probably should.

Usage

```
gather_ontology_genes(result, ontology = NULL,
  column = "over_represented_pvalue", pval = 0.1,
  include_all = FALSE, ...)
```

Arguments

result List of results as generated by simple_*().

ontology Ontology to search (MF/BP/CC).

column Which column to use for extracting ontologies?

pval Maximum accepted pvalue to include in the list of categories to cross reference.

include_all Include all genes in the ontology search?... Extra options without a purpose just yet.

Value

Data frame of categories/genes.

See Also

```
goseq clusterProfiler simple_goseq
```

86 gather_utrs_padding

Examples

Description

For some species, we do not have a fully realized set of UTR boundaries, so it can be useful to query some arbitrary and consistent amount of sequence before/after every CDS sequence. This function can provide that information.

Usage

```
gather_utrs_padding(bsgenome, annot_df, name_column = "gid",
    chr_column = "chromosome", start_column = "start",
    end_column = "end", strand_column = "strand",
    type_column = "annot_gene_type", gene_type = "protein coding",
    padding = 120, ...)
```

Arguments

_	
bsgenome	BSgenome object containing the genome of interest.
annot_df	Annotation data frame containing all the entries of interest, this is generally extracted using a function in the load_something_annotations() family (load_orgdb_annotations() being the most likely).
name_column	Give each gene a name using this column.
chr_column	Column name of the chromosome names.
start_column	Column name of the start information.
end_column	Ibid, end column.
strand_column	Ibid, strand.
type_column	Subset the annotation data using this column, if not null.
gene_type	Subset the annotation data using the type_column with this type.
padding	Return this number of nucleotides for each gene.

Arguments passed to child functions (I think none currently).

Value

List of 2 elements, the 5' and 3' regions.

gather_utrs_txdb 87

gather_utrs_txdb Get UTR sequences using information provided by TxDb and fiveU- TRsByTranscript	gather_utrs_txdb	
---	------------------	--

Description

For species like Mus musculus, load_orgdb_annotations(Mus.musculus) should return a list including the requisite GRanges for the 5'/3' UTRs.

Usage

```
gather_utrs_txdb(bsgenome, fivep_utr = NULL, threep_utr = NULL,
    start_column = "start", end_column = "end",
    strand_column = "strand", chr_column = "seqnames",
    name_column = "group_name", ...)
```

Arguments

bsgenome	A BSGenome instance containing the encoded genome.
Dagerionic	A DOCTIONIC Instance containing the encoded genome.

fivep_utr Locations of the 5' UTRs. threep_utr Locations of the 3' UTRs.

start_column What column in the annotation data contains the starts?

end column in the data with the end locations.

strand_column What column in the annotation data contains the sequence strands?

chr_column Column in the df with the chromosome names.

name_column Finally, where are the gene names?
... Parameters passed to child functions.

Value

UTRs!

gbk_annotations Extract some useful information from a gbk imported as a txDb.	gbk_annotations	Extract some useful information from a gbk imported as a txDb.	
--	-----------------	--	--

Description

Maybe this should get pulled into the previous function?

Usage

```
gbk_annotations(gbr)
```

88 genefilter_cv_counts

Arguments

gbr

TxDb object to poke at.

Details

Tested in test_40ann_biomartgenbank.R This function should provide a quick reminder of how to use the AnnotationDbi select function if it does nothing else. It also (hopefully helpfully) returns a granges object containing the essential information one might want for printing out a gff or whatever.

I should revisit this function and improve the generated ranges objects to have better metadata columns via the mcols() function. For examples of some useful tasks one can do here, check out snp.r.

Value

Granges data

Author(s)

atb

See Also

AnnotationDbi GenomeInfoDb GenomicFeatures select

Examples

```
## Not run:
annotations <- gbk_annotations("saureus_txdb")
## End(Not run)</pre>
```

genefilter_cv_counts Filter genes from a dataset outside a range of variance.

Description

This function from genefilter removes genes surpassing a variance cutoff. It is not therefore a low-count filter per se.

Usage

```
genefilter_cv_counts(count_table, cv_min = 0.01, cv_max = 1000)
```

genefilter_kofa_counts 89

Arguments

count_table Input data frame of counts by sample.

cv_min Minimum coefficient of variance.

cv_max Maximum coefficient of variance.

Value

Dataframe of counts without the high/low variance genes.

See Also

```
genefilter kOverA
```

Examples

```
## Not run:
    filtered_table = genefilter_kofa_counts(count_table)
## End(Not run)
```

```
genefilter_kofa_counts
```

Filter low-count genes from a data set using genefilter's kOverA().

Description

This is the most similar to the function suggested by Hector I think.

Usage

```
genefilter_kofa_counts(count_table, k = 1, A = 1)
```

Arguments

count_table Input data frame of counts by sample.

k Minimum number of samples to have >A counts.

A Minimum number of counts for each gene's sample in kOverA().

Value

Dataframe of counts without the low-count genes.

See Also

```
genefilter kOverA
```

Examples

```
## Not run:
  filtered_table = genefilter_kofa_counts(count_table)
## End(Not run)
```

```
genefilter_pofa_counts
```

Filter low-count genes from a data set using genefilter's pOverA().

Description

I keep thinking this function is pofa... oh well. Of the various tools in genefilter, this one to me is the most intuitive. Take the ratio of counts/samples and make sure it is >= a score.

Usage

```
genefilter_pofa_counts(count_table, p = 0.01, A = 100)
```

Arguments

count_table Input data frame of counts by sample.

p Minimum proportion of each gene's counts/sample to be greater than a mini-

mum(A).

A Minimum number of counts in the above proportion.

Value

Dataframe of counts without the low-count genes.

See Also

```
genefilter poverA
```

Examples

```
## Not run:
  filtered_table = genefilter_pofa_counts(count_table)
## End(Not run)
```

generate_expt_colors 91

generate_expt_colors Set up default colors for a data structure containing usable metadata

Description

In theory this function should be useful in any context when one has a blob of metadata and wants to have a set of colors. Since my taste is utterly terrible, I rely entirely upon RColorBrewer, but also allow one to choose his/her own colors.

Usage

```
generate_expt_colors(sample_definitions, cond_column = "condition", ...)
```

Arguments

sample_definitions

Metadata, presumably containing a 'condition' column.

cond_column

Which column in the sample data provides the set of 'conditions' used to define

the colors?

... Other arguments like a color palette, etc.

Value

Colors!

genoplot_chromosome

Try plotting a chromosome (region)

Description

```
genoplotr is cool, I don't yet understand it though
```

Usage

```
genoplot_chromosome(accession = "AE009949", start = NULL, end = NULL,
  title = "Genome plot")
```

Arguments

accession An accession to plot, this will download it.
start First segment to plot (doesn't quite work yet).
end Final segment to plot (doesn't quite work yet).

title Put a title on the resulting plot.

92 get_abundant_genes

Value

Hopefully a pretty plot of a genome

See Also

genoPlotR

getEdgeWeights

Plot the ontology DAG.

Description

This function was stolen from topgo in order to figure out where it was failing.

Usage

```
getEdgeWeights(graph)
```

Arguments

graph

Graph from topGO

Value

Weights!

get_abundant_genes

Find the set of most/least abundant genes according to limma and friends following a differential expression analysis.

Description

Given a data set provided by limma, deseq, edger, etc; one might want to know what are the most and least abundant genes, much like get_sig_genes() does to find the most significantly different genes for each contrast.

Usage

```
get_abundant_genes(datum, type = "limma", n = NULL, z = NULL,
    unique = FALSE, least = FALSE)
```

get_eupath_fields 93

Arguments

datum	Output from the _pairwise() functions.
type	Extract abundant genes according to what?
n	Perhaps take just the top/bottom n genes.
z	Or take genes past a given z-score.

unique Unimplemented: take only the genes unique among the conditions surveyed.

least When true, this finds the least abundant rather than most.

Value

List of data frames containing the genes of interest.

See Also

```
stats limma DESeq2 edgeR
```

Examples

```
## Not run:
   abundant <- get_abundant_genes(all_pairwise_output, type="deseq", n=100)
   ## Top 100 most abundant genes from deseq
   least <- get_abundant_genes(all_pairwise_output, type="deseq", n=100, least=TRUE)
   ## Top 100 least abundant genes from deseq
   abundant <- get_abundant_genes(all_pairwise_output, type="edger", z=1.5)
   ## Get the genes more than 1.5 standard deviations from the mean.

## End(Not run)</pre>
```

get_eupath_fields

Extract query-able fields from the EupathDb.

Description

This parses the result of a query to Eupath's webservice: 'GenesByMolecularWeight' and uses it to get a list of fields which are acquireable elsewhere.

Usage

```
get_eupath_fields(webservice)
```

Arguments

webservice Eupathdb, tritrypdb, fungidb, etc...

Value

List of parameters.

get_eupath_pkgnames	Generate standardized package names for the various eupathdb species.
---------------------	---

Description

This is a surprisingly difficult problem. Many species names in the eupathdb have odd characters in the species suffix which defines the strain ID. Many of these peculiarities result in packages which are non-viable for installation. Thus this function attempts to filter them out and result in consistent, valid package names. They are not exactly the same in format as other orgdb/txdb/etc packages, as I include in them a field for the eupathdb version used; but otherwise they should be familiar to any user of the sqlite based organism packages.

Usage

```
get_eupath_pkgnames(species = "Coprinosis.cinerea.okayama7#130",
   version = NULL, metadata = NULL, ...)
```

Arguments

species	Species names taken from a metadata instance from a eupath project.
version	Choose a specific version of the eupathdb, only really useful when downloading files.
metadata	Eupathdb metadata.
	Further arguments to pass to download_eupath_metadata()

Details

The default argument for this function shows the funniest one I have found so far thanks to the hash character in the strain definition.

Value

List of package names and some booleans to see if they have already been installed.

Author(s)

atb

get_genesizes 95

get_genesizes	Grab gene length/width/size from an annotation database.

Description

This function tries to gather an appropriate gene length column from whatever annotation data source is provided.

Usage

```
get_genesizes(annotation = NULL, type = "gff", gene_type = "gene",
  type_column = "type", key = NULL, length_names = NULL, ...)
```

Arguments

annotation	There are a few likely data sources when getting gene sizes, choose one with this.
type	What type of annotation data are we using?
gene_type	Annotation type to use (3rd column of a gff file).
type_column	Type identifier (10th column of a gff file).
key	What column has ID information?
length_names	Provide some column names which give gene length information?
	Extra arguments likely for load_annotations()

Value

Data frame of gene IDs and widths.

Author(s)

atb

See Also

```
rtracklayer load_gff_annotations
```

Examples

96 get_gsvadb_names

```
## 6 YAL068W-A
## End(Not run)
```

get_git_commit

Get the current git commit for hpgltools

Description

One might reasonably ask about this function: "Why?" I invoke this function at the end of my various knitr documents so that if necessary I can do a > git reset <commit id> and get back to the exact state of my code. As a bonus, since I have this under packrat I can furthermore use packrat reset to get the exact state of all the packages, too!

Usage

```
get_git_commit(gitdir = "~/hpgltools", packrat = FALSE)
```

Arguments

gitdir Directory containing the git repository.
packrat Is this tree under packrat control?

get_gsvadb_names

Extract the GeneSets corresponding to the provided name(s).

Description

Many of the likely GSCs contain far more gene sets than one actually wants to deal with. This will subset them according to a the desired 'requests'.

Usage

```
get_gsvadb_names(sig_data, requests = NULL)
```

Arguments

sig_data The pile of GeneSets, probably from GSVAdata.

requests Character list of sources to keep.

Value

Whatever GeneSets remain.

get_individual_snps 97

Description

The result of get_snp_sets provides sets of snps for all possible categories. This is cool and all, but most of the time we just want the results of a single group in that rather large set (2^number of categories)

Usage

```
get_individual_snps(retlist)
```

Arguments

retlist The result from get_snp_sets().

get_kegg_genes

Extract the set of geneIDs matching pathways for a given species.

Description

This uses KEGGREST to extract the mappings for all genes for a species and pathway or 'all'. Because downloading them takes a while, it will save the results to kegg_species.rda. When run interactively, it will give some information regarding the number of genes observed in each pathway.

Usage

```
get_kegg_genes(pathway = "all", abbreviation = NULL,
   species = "leishmania major", savefile = NULL)
```

Arguments

pathway Either a single pathway kegg id or 'all'.

abbreviation Optional 3 letter species kegg id.

species Stringified species name used to extract the 3 letter abbreviation.

savefile Filename to which to save the relevant data.

Value

Dataframe of the various kegg data for each pathway, 1 row/gene.

See Also

KEGGREST

98 get_kegg_orgn

Examples

```
## Not run:
   kegg_info <- get_kegg_genes(species="Canis familiaris")
## End(Not run)</pre>
```

get_kegg_orgn

Search KEGG identifiers for a given species name.

Description

KEGG identifiers do not always make sense. For example, how am I supposed to remember that Leishmania major is lmj? This takes in a human readable string and finds the KEGG identifiers that match it.

Usage

```
get_kegg_orgn(species = "Leishmania", short = TRUE)
```

Arguments

species Search string (Something like 'Homo sapiens').

short Only pull the orgid?

Value

Data frame of possible KEGG identifier codes, genome ID numbers, species, and phylogenetic classifications.

See Also

RCurl

Examples

```
## Not run:
    fun = get_kegg_orgn('Canis')
    ## > Tid orgid species phylogeny
## > 17 T01007 cfa Canis familiaris (dog) Eukaryotes; Animals; Vertebrates; Mammals
## End(Not run)
```

get_kegg_sub

get_kegg_sub	Provide a set of simple substitutions to convert geneIDs from KEGG- >TriTryDB
--------------	--

Description

This function should provide 2 character lists which, when applied sequentially, will result in a hopefully coherent set of mapped gene IDs matching the TriTypDB/KEGG specifications.

Usage

```
get_kegg_sub(species = "lma")
```

Arguments

species

3 letter abbreviation for a given kegg type

Value

2 character lists containing the patterns and replace arguments for gsub(), order matters!

See Also

KEGGREST

get_msigdb_metadata	Create a metadata dataframe of msigdb data, this hopefully will be
	usable to fill the fData slot of a gsva returned expressionset.

Description

Create a metadata dataframe of msigdb data, this hopefully will be usable to fill the fData slot of a gsva returned expressionset.

Usage

```
get_msigdb_metadata(sig_data = NULL, msig_xml = "msigdb_v6.2.xml",
    gsva_result = NULL)
```

Arguments

sig_dataGeneSetCollection from the broad msigdb.msig_xmlmsig XML file downloaded from broad.gsva_resultSome data from GSVA to modify.

Value

list containing 2 data frames: all metadata from broad, and the set matching the sig_data GeneSets.

```
get_orthologs_all_genes
```

Query ortholog tables from the eupathdb one gene at a time.

Description

Querying the full ortholog table at eupathdb.org fails mysteriously. This is a horrible brute-force approach to get around this.

Usage

```
get_orthologs_all_genes(species = "Leishmania major", dir = "eupathdb",
  entry = NULL, metadata = NULL, ...)
```

Arguments

species	What species to query
dir	Directory to which to save intermediate data (currently unused)
entry	An entry from the eupathdb metadata to use for other parameters.
metadata	The set of eupathdb metadata from which to query.
	Extra parameters for downloading eupathdb metadata.

Description

Instead of pulling to top/bottom abundant genes, get all abundances and variances or stderr.

Usage

```
get_pairwise_gene_abundances(datum, type = "limma", excel = NULL)
```

Arguments

datum Output from _pairwise() functions.

type According to deseq/limma/ed ger/basic?

excel Print this to an excel file?

Value

A list containing the expression values and some metrics of variance/error.

get_res 101

See Also

limma

Examples

```
## Not run:
   abundance_excel <- get_pairwise_gene_abundances(combined, excel="abundances.xlsx")
## This should provide a set of abundances after voom by condition.
## End(Not run)</pre>
```

get_res

Attempt to get residuals from tsne data

Description

I strongly suspect that this is not correct, but it is a start.

Usage

```
get_res(svd_result, design, factors = c("condition", "batch"),
  res_slot = "v", var_slot = "d")
```

Arguments

svd_result	The set of results from one of the many potential svd-ish methods.
design	Experimental design from which to get experimental factors.
factors	Set of experimental factors for which to calculate rsquared values.
res_slot	Where is the res data in the svd result?
var_slot	Where is the var data in the svd result?

get_sig_genes

Get a set of up/down differentially expressed genes.

Description

Take one or more criteria (fold change, rank order, (adj)p-value, z-score from median FC) and use them to extract the set of genes which are defined as 'differentially expressed.' If no criteria are provided, it arbitrarily chooses all genes outside of 1-z.

Usage

```
get_sig_genes(table, n = NULL, z = NULL, lfc = NULL, p = NULL,
column = "logFC", fold = "plusminus", p_column = "adj.P.Val")
```

get_snp_sets

Arguments

table	Table from limma/edger/deseq.
n	Rank-order top/bottom number of genes to take.
z	Number of z-scores >/< the median to take.
lfc	Fold-change cutoff.
p	P-value cutoff.
column	Table's column used to distinguish top vs. bottom.
fold	Identifier reminding how to get the bottom portion of a fold-change (plusminus says to get the negative of the positive, otherwise 1/positive is taken). This effectively tells me if this is a log fold change or not.
p_column	Table's column containing (adjusted or not)p-values.

Details

Tested in test_29de_shared.R

Value

Subset of the up/down genes given the provided criteria.

See Also

```
extract_significant_genes
```

Examples

```
## Not run:
    sig_table <- get_sig_genes(table, lfc=1)
## End(Not run)</pre>
```

get_snp_sets

Create all possible sets of variants by sample (types).

Description

I like this function. It generates an exhaustive catalog of the snps by chromosome for all the various categories as defined by factor.

Usage

```
get_snp_sets(snp_expt, factor = "pathogenstrain", limit = 1,
   do_save = FALSE, savefile = "variants")
```

gff2irange 103

Arguments

Shp_expt The result of count expt ships	snp_expt	The result of count_expt_snps()
---	----------	---------------------------------

factor Experimental factor to use for cutting and splicing the data.

limit Minimum median number of hits / factor to define a position as a hit.

do_save Save the result?

savefile Prefix for a savefile if one chooses to save the result.

Value

A funky list by chromosome containing: 'medians', the median number of hits / position by sample type; 'possibilities', the; 'intersections', the groupings as detected by Vennerable; 'chr_data', the raw data; 'set_names', a character list of the actual names of the groupings; 'invert_names', the opposite of set_names which is to say the names of groups which do _not_ include samples x,y,z; 'density', a list of snp densities with respect to chromosomes. Note that this last one is approximate as I just calculate with the largest chromosome position number, not the explicit number of nucleotides in the chromosome.

gff2irange

Extract annotation information from a gff file into an irange object.

Description

Try to make import.gff a little more robust; I acquire (hopefully) valid gff files from various sources: yeastgenome.org, microbesonline, tritrypdb, ucsc, ncbi. To my eyes, they all look like reasonably good gff3 files, but some of them must be loaded with import.gff2, import.gff3, etc. That is super annoying. Also, I pretty much always just do as.data.frame() when I get something valid from rtracklayer, so this does that for me, I have another function which returns the iranges etc. This function wraps import.gff/import.gff3/import.gff2 calls in try() because sometimes those functions fail in unpredictable ways.

Usage

```
gff2irange(gff, type = NULL)
```

Arguments

gff Gff filename. type Subset to extract.

Details

This is essentially load_gff_annotations(), but returns data suitable for getSet() This is another place which should be revisited for improvements via mcols(). Check snp.r. for ideas.

104 ggplt

Value

```
Iranges! (useful for getSeq().)
```

Author(s)

atb

See Also

```
rtracklayer load_gff_annotations Biostrings import.gff
```

Examples

```
## Not run:
library(BSgenome.Tcruzi.clbrener.all)
tc_clb_all <- BSgenome.Tcruzi.clbrener.all
cds_ranges <- gff2irange('reference/gff/tcruzi_clbrener.gff.xz', type='CDS')
cds_sequences <- Biostrings::getSeq(tc_clb_all, cds_ranges)
## End(Not run)</pre>
```

ggplt

Simplify plotly ggplot conversion so that there are no shenanigans.

Description

I am a fan of ggplotly, but its conversion to an html file is not perfect. This hopefully will get around the most likely/worst problems.

Usage

```
ggplt(gg, filename = "ggplot.html", selfcontained = TRUE,
  libdir = NULL, background = "white", title = class(gg)[[1]],
  knitrOptions = list(), ...)
```

Arguments

gg Plot from ggplot2. filename Output filename.

selfcontained htmlwidgets: Return the plot as a self-contained file with images re-encoded

base64.

libdir htmlwidgets: Directory into which to put dependencies. background htmlwidgets: String for the background of the image.

title htmlwidgets: Title of the page!

knitrOptions htmlwidgets: I am not a fan of camelCase, but nonetheless, options from knitr

for htmlwidgets.

... Any remaining elipsis options are passed to ggplotly.

godef 105

Value

The final output filename

godef

Get a go long-form definition from an id.

Description

Sometimes it is nice to be able to read the full definition of some GO terms.

Usage

```
godef(go = "GO:0032432")
```

Arguments

go

GO ID, this may be a character or list (assuming the elements are goids).

Value

Some text providing the long definition of each provided GO id.

See Also

GOTerms Ann Db Bimap

Examples

```
## Not run:
godef("GO:0032432")
## > GO:0032432
## > "An assembly of actin filaments that are on the same axis but may be
## > same or opposite polarities and may be packed with different levels of tightness."
## End(Not run)
```

106 golevel

golev

Get a go level approximation from an ID.

Description

Sometimes it is useful to know how far up/down the ontology tree a given id resides. This attmepts to answer that question.

Usage

```
golev(go)
```

Arguments

go

GO id, this may be a character or list (assuming the elements are goids).

Value

Set of numbers corresponding to approximate tree positions of the GO ids.

See Also

GOTermsAnnDbBimap

Examples

```
## Not run:
  golev("GO:0032559")
## > 3
## End(Not run)
```

golevel

Get a go level approximation from a set of IDs.

Description

This just wraps golev() in mapply.

Usage

```
golevel(go = c("GO:0032559", "GO:0000001"))
```

Arguments

go

Character list of IDs.

golevel_df 107

Value

Set pf approximate levels within the onlogy.

See Also

GOTermsAnnDbBimap

Examples

```
## Not run:
  golevel(c("GO:0032559", "GO:0000001")
## > 3 4
## End(Not run)
```

golevel_df

Extract a dataframe of golevels using getGOLevel() from clusterProfiler.

Description

This function is way faster than my previous iterative golevel function. That is not to say it is very fast, so it saves the result to ontlevel.rda for future lookups.

Usage

```
golevel_df(ont = "MF", savefile = "ontlevel.rda")
```

Arguments

ont the ontology to recurse.

savefile a file to save the results for future lookups.

Value

golevels a dataframe of goids<->highest level

See Also

clusterProfiler

108 gosec

goont

Get a go ontology name from an ID.

Description

Get a go ontology name from an ID.

Usage

```
goont(go = c("G0:0032432", "G0:0032433"))
```

Arguments

go

GO id, this may be a character or list (assuming the elements are goids).

Value

The set of ontology IDs associated with the GO ids, thus 'MF' or 'BP' or 'CC'.

See Also

GOTermsAnnDbBimap

Examples

```
## Not run:
  goont(c("GO:0032432", "GO:0032433"))
## > GO:0032432 GO:0032433
## > "CC" "CC"
## End(Not run)
```

gosec

Get a GO secondary ID from an id.

Description

Unfortunately, GOTERM's returns for secondary IDs are not consistent, so this function has to have a whole bunch of logic to handle the various outputs.

Usage

```
gosec(go = "GO:0032432")
```

Arguments

go

GO ID, this may be a character or list(assuming the elements, not names, are goids).

goseq_table 109

Value

Some text comprising the secondary GO id(s).

See Also

GOTermsAnnDbBimap

Examples

```
## Not run:
    gosec("G0:0032432")
    ## > G0:0032432
    ## > "G0:0000141" "G0:0030482"
## End(Not run)
```

goseq_table

Enhance the goseq table of gene ontology information.

Description

While goseq has some nice functionality, the table of outputs it provides is somewhat lacking. This attempts to increase that with some extra helpful data like ontology categories, definitions, etc.

Usage

```
goseq_table(df, file = NULL)
```

Arguments

df

Dataframe of ontology information. This is intended to be the output from goseq including information like numbers/category, GOids, etc. It requires a column

'category' which contains: GO:000001 and such.

file

Csv file to which to write the table.

Value

Ontology table with annotation information included.

See Also

## > 571 GO:0006365 Any process involved in the conversion of a primary ribosomal
          RNA (rRNA) transcript into one or more mature rRNA molecules.
## End(Not run)
```

goseq_trees

Make fun trees a la topgo from goseq data.

Description

This seeks to force goseq data into a format suitable for topGO and then use its tree plotting function to make it possible to see significantly increased ontology trees.

Usage

```
goseq_trees(goseq, goid_map = "id2go.map", score_limit = 0.01,
  overwrite = FALSE, selector = "topDiffGenes",
  pval_column = "adj.P.Val")
```

Arguments

goseq	Data from goseq.
goid_map	File to save go id mapping.
score_limit	Score limit for the coloring.
overwrite	Overwrite the trees?
selector	Function for choosing genes.
pval_column	Column to acquire pvalues.

Value

A plot!

See Also

Ramigo

gostats_kegg 111

	gostats_kegg	Use gostats() against kegg pathways.	
--	--------------	--------------------------------------	--

Description

This sets up a GSEABase analysis using KEGG pathways rather than gene ontologies. Does this even work? I don't think I have ever tested it yet. oh, it sort of does, maybe if I export it I will rembmer it.

Usage

```
gostats_kegg(organism = "Homo sapiens", pathdb = "org.Hs.egPATH",
  godb = "org.Hs.egGO")
```

Arguments

organism The organism used to make the KEGG frame, human readable no taxonomic.

pathdb Name of the pathway database for this organism. godb Name of the ontology database for this organism.

Value

Results from hyperGTest using the KEGG pathways.

See Also

AnnotationDbi GSEABase Category

gostats_trees	Take gostats data and print it on a tree as topGO does.	

Description

This shoehorns gostats data into a format acceptable by topgo and uses it to print pretty ontology trees showing the over represented ontologies.

Usage

```
gostats_trees(de_genes, mf_over, bp_over, cc_over, mf_under, bp_under,
    cc_under, goid_map = "id2go.map", score_limit = 0.01, go_db = NULL,
    overwrite = FALSE, selector = "topDiffGenes",
    pval_column = "adj.P.Val")
```

112 gosyn

Arguments

de_genes Some differentially expressed genes.

mf_overMfover data.bp_overBpover data.cc_overCcover data.mf_underMfunder data.bp_underBpunder data.

goid_map Mapping of IDs to GO in the Ramigo expected format.

score_limit Maximum score to include as 'significant'.

go_db Dataframe of available goids (used to generate goid_map).

overwrite Overwrite the goid_map?

selector Function to choose differentially expressed genes in the data.

pval_column in the data to be used to extract pvalue scores.

Value

plots! Trees! oh my!

See Also

topGO gostats

gosyn	Get a go synonym from an ID.
-------	------------------------------

Description

I think I will need to do similar parsing of the output for this function as per gosec() In some cases this also returns stuff like c("some text", "GO:someID") versus "some other text" versus NULL versus NA. This function just goes a mapply(gosn, go).

Usage

```
gosyn(go = "GO:0000001")
```

Arguments

go GO id, this may be a character or list(assuming the elements are goids).

Value

Some text providing the synonyms for the given id(s).

goterm 113

See Also

GOTermsAnnDbBimap

Examples

```
## Not run:
  text = gosyn("GO:0000001")
  text
  ## > GO:000001
  ## > "mitochondrial inheritance"
## End(Not run)
```

goterm

Get a go term from ID.

Description

Get a go term from ID.

Usage

```
goterm(go = "GO:0032559")
```

Arguments

go

GO id or a list thereof, this may be a character or list(assuming the elements, not names, are goids).

Value

Some text containing the terms associated with GO id(s).

See Also

GOTermsAnnDbBimap

```
## Not run:
  goterm("GO:0032559")
## > GO:0032559
## > "adenyl ribonucleotide binding"
## End(Not run)
```

graph_metrics

gotest

Test GO ids to see if they are useful.

Description

This just wraps gotst in mapply.

Usage

```
gotest(go)
```

Arguments

go

go IDs as characters.

Value

Some text

See Also

GOTermsAnnDbBimap

Examples

```
## Not run:
  gotest("G0:0032559")
  ## > 1
  gotest("G0:0923429034823904")
  ## > 0
## End(Not run)
```

graph_metrics

Make lots of graphs!

Description

Plot out a set of metrics describing the state of an experiment including library sizes, # non-zero genes, heatmaps, boxplots, density plots, pca plots, standard median distance/correlation, and qq plots.

Usage

```
graph_metrics(expt, cormethod = "pearson", distmethod = "euclidean",
  title_suffix = NULL, qq = FALSE, ma = FALSE, gene_heat = FALSE,
  ...)
```

graph_metrics 115

Arguments

expt an expt to process

cormethod the correlation test for heatmaps.

distmethod define the distance metric for heatmaps. title_suffix text to add to the titles of the plots.

qq include qq plots?

ma include pairwise ma plots?

gene_heat Include a heatmap of the gene expression data?
... extra parameters optionally fed to the various plots

Value

a loooong list of plots including the following:

- 1. nonzero = a ggplot2 plot of the non-zero genes vs library size
- 2. libsize = a ggplot2 bar plot of the library sizes
- 3. boxplot = a ggplot2 boxplot of the raw data
- 4. corheat = a recordPlot()ed pairwise correlation heatmap of the raw data
- 5. smc = a recordPlot()ed view of the standard median pairwise correlation of the raw data
- 6. disheat = a recordPlot()ed pairwise euclidean distance heatmap of the raw data
- 7. smd = a recordPlot()ed view of the standard median pairwise distance of the raw data
- 8. pcaplot = a recordPlot()ed PCA plot of the raw samples
- 9. pcatable = a table describing the relative contribution of condition/batch of the raw data
- 10. pcares = a table describing the relative contribution of condition/batch of the raw data
- 11. pcavar = a table describing the variance of the raw data
- 12. qq = a recordPlotted() view comparing the quantile/quantiles between the mean of all data and every raw sample
- 13. density = a ggplot2 view of the density of each raw sample (this is complementary but more fun than a boxplot)

See Also

116 gsva_likelihoods

Description

Yeah, this is a bit meta, but the scores from gsva seem a bit meaningless to me, so I decided to look at the distribution of observed scores in some of my data; I quickly realized that they follow a nicely normal distribution. Therefore, I thought to calculate some scores of gsva() using that information.

Usage

```
gsva_likelihoods(gsva_result, score = NULL, category = NULL,
factor = NULL, sample = NULL, factor_column = "condition",
  method = "mean")
```

Arguments

 ${\tt gsva_result} \qquad {\tt Input \ result \ from \ simple_gsva()}$

score What type of scoring to perform, against a value, column, row?

category What category to use as baseline?

factor Which experimental factor to compare against?

sample Which sample to compare against?

factor_column When comparing against an experimental factor, which design column to use to

ind it's

method mean or median when bringing together values?

Details

The nicest thing in this, I think, is that it provides its scoring metric(s) according to a few different possibilities, including: * the mean of samples found in an experimental factor * All provided scores against the distribution of observed scores as z-scores. * A single score against all scores. * Rows (gene sets) against the set of all gene sets.

Value

The scores according to the provided category, factor, sample, or score(s).

guess_orgdb_keytype 117

guess_orgdb_keytype

Iterate over keytypes looking for matches against a set of IDs.

Description

Sometimes, one does not know what the correct keytype is for a given set of IDs. This will hopefully find them.

Usage

```
guess_orgdb_keytype(ids, orgdb)
```

Arguments

ids

Set of gene IDs to seek.

orgdb

Orgdb instance to iterate through.

Value

Likely keytype which provides the desired IDs.

heatmap.3

a minor change to heatmap.2 makes heatmap.3

Description

heatmap.2 is the devil.

Usage

```
heatmap.3(x, Rowv = TRUE, Colv = if (symm) "Rowv" else TRUE, distfun = dist, hclustfun = hclust, dendrogram = c("both", "row", "column", "none"), reorderfun = function(d, w) reorder(d, w), symm = FALSE, scale = c("none", "row", "column"), na.rm = TRUE, revC = identical(Colv, "Rowv"), add.expr, breaks, symbreaks = min(x < 0, na.rm = TRUE) || scale != "none", col = "heat.colors", colsep, rowsep, sepcolor = "white", sepwidth = c(0.05, 0.05), cellnote, notecex = 1, notecol = "cyan", na.color = par("bg"), trace = c("column", "row", "both", "none"), tracecol = "cyan", hline = median(breaks), vline = median(breaks), linecol = tracecol, margins = c(5, 5), ColSideColors, RowSideColors, cexRow = 0.2 + 1/log10(nr), cexCol = 0.2 + 1/log10(nc), labRow = NULL, labCol = NULL, srtRow = NULL, srtCol = NULL, adjRow = c(0, NA), adjCol = c(NA, 0), offsetRow = 0.5, offsetCol = 0.5, key = TRUE, keysize = 1.5, density.info = c("histogram", "density", "none"),
```

118 heatmap.3

```
denscol = tracecol, symkey = min(x < 0, na.rm = TRUE) || symbreaks, densadj = 0.25, key.title = NULL, key.xlab = NULL, key.ylab = NULL, key.xtickfun = NULL, key.ytickfun = NULL, key.par = list(), main = NULL, xlab = NULL, ylab = NULL, lmat = NULL, lhei = NULL, lwid = NULL, extrafun = NULL, linewidth = 1, ...)
```

Arguments

x data
Rowv add rows?
Colv add columns?

distfun distance function to use hclustfun clustering function to use dendrogram which axes to put trees on reorderfun reorder the rows/columns?

symm symmetrical? scale add the scale?

na.rm remove nas from the data?
revC reverse the columns?

add.expr no clue
breaks also no clue
symbreaks still no clue
col colors!

colsep column separator rowsep row separator

sepcolor color to put between columns/rows

sepwidth how much to separate

cellnote mur?

notecex size of the notes
notecol color of the notes
na.color a parameter call to bg

trace do a trace for rows/columns?

tracecol color of the trace

hline the hline
vline the vline
linecol the line color
margins margins are good

ColSideColors colors for the columns as annotation

heatmap.3

RowSideColors colors for the rows as annotation

cexRow row size cexCol column size labRow hmmmm labCol still dont know srt the row? srtRow srt the column? srtCol adjRow adj the row? adjCol adj the column?

offsetRow how far to place the text from the row offsetCol how far to place the text from the column

key add a key? keysize if so, how big?

density.info for the key, what information to add

denscol tracecol hmm ok symkey I like keys densadj adj the dens? key.title title for the key

key.xlab text for the x axis of the key key.ylab text for the y axis of the key

key.xtickfun add text to the ticks of the key x axis key.ytickfun add text to the ticks of the key y axis

key.par parameters for the key main the main title of the plot

xlab main x label
ylab main y label
lmat the lmat
lhei the lhei
lwid the lwid

extrafun I do enjoy me some extra fun

linewidth the width of lines

... because this function did not already have enough options

Value

a heatmap!

See Also

heatmap.2

hpgl_arescore

hpgltools	hpgltools: a suite of tools to make our analyses easier

Description

This provides a series of helpers for working with sequencing data

Details

It falls under a few main topics

- Data exploration, look for trends in sequencing data and identify batch effects or skewed distributions.
- Differential expression analyses, use DESeq2/limma/EdgeR in a hopefully robust and flexible fashion.
- Ontology analyses, use goseq/clusterProfiler/topGO/GOStats/gProfiler in hopefully robust ways.
- Perform some simple TnSeq analyses.

To see examples of this in action, check out the vignettes: browseVignettes(package = 'hpgltools')

hpgl_arescore	Implement the arescan function in R
i_arescore	Implement the arescan junction in K

Description

This function was taken almost verbatim from AREScore() in SeqTools Available at: https://github.com/lianos/seqtools.git At least on my computer I could not make that implementation work So I rewrapped its apply() calls and am now hoping to extend its logic a little to make it more sensitive and get rid of some of the spurious parameters or at least make them more transparent.

Usage

```
hpgl_arescore(x, basal = 1, overlapping = 1.5, d1.3 = 0.75,
    d4.6 = 0.4, d7.9 = 0.2, within.AU = 0.3, aub.min.length = 10,
    aub.p.to.start = 0.8, aub.p.to.end = 0.55)
```

Arguments

x	DNA/RNA StringSet containing the UTR sequences of interest
basal	I dunno.
overlapping	default=1.5
d1.3	default=0.75 These parameter names are so stupid, lets be realistic
d4.6	default=0.4

hpgl_cor 121

```
d7.9 default=0.2 within.AU default=0.3 aub.min.length default=10 aub.p.to.start default=0.8 aub.p.to.end default=0.55
```

Value

a DataFrame of scores

See Also

IRanges Biostrings

Examples

```
## Extract all the genes from my genome, pull a static region 120nt following the stop
## and test them for potential ARE sequences.
## FIXME: There may be an error in this example, another version I have
## handles the +/- strand genes separately, I need to return to this and check
## if it is providing the 5' UTR for 1/2 the genome, which would be
\#\# unfortunate -- but the logic for testing remains the same.
are_candidates <- hpgl_arescore(genome)</pre>
utr_genes <- subset(lmajor_annotations, type == 'gene')</pre>
threep <- GenomicRanges::GRanges(seqnames=Rle(utr_genes[,1]),</pre>
                                ranges=IRanges(utr_genes[,3], end=(utr_genes[,3] + 120)),
                                   strand=Rle(utr_genes[,5]),
                                   name=Rle(utr_genes[,10]))
threep_seqstrings <- Biostrings::getSeq(lm, threep)</pre>
are_test <- hpgltools::hpgl_arescore(x=threep_seqstrings)</pre>
are_genes <- rownames(are_test[ which(are_test$score > 0), ])
## End(Not run)
```

hpgl_cor

Wrap cor() to include robust correlations.

Description

Take covRob's robust correlation coefficient and add it to the set of correlations available when one calls cor(). I should reimplement this using S4.

Usage

```
hpgl_cor(df, method = "pearson", ...)
```

hpgl_dist

Arguments

df Data frame to test.

method Correlation method to use. Includes pearson, spearman, kendal, robust.

. . . Other options to pass to stats::cor().

Value

Some fun correlation statistics.

See Also

```
robust cor cov covRob
```

Examples

```
## Not run:
hpgl_cor(df=df)
hpgl_cor(df=df, method="robust")
## End(Not run)
```

hpgl_dist

Because I am not smart enough to remember t()

Description

It seems to me there should be a function as easy for distances are there is for correlations.

Usage

```
hpgl_dist(df, method = "euclidean", ...)
```

Arguments

df data frame from which to calculate distances.

method Which distance calculation to use?

... Extra arguments for dist.

hpgl_filter_counts 123

hpgl_filter_counts

Filter low-count genes from a data set using cpm data and a threshold.

Description

This is identical to cbcb_filter_counts except it does not do the somewhat tortured log2CPM() but instead just uses a 4 cpm non-log threshold. It should therefore give basically the same result, but without the shenanigans.

Usage

```
hpgl_filter_counts(count_table, threshold = 2, min_samples = 2,
   libsize = NULL, ...)
```

Arguments

count_table Data frame of (pseudo)counts by sample.

threshold Lower threshold of counts for each gene.

min_samples Minimum number of samples.

libsize Table of library sizes.

Arguments passed to cpm and friends.

Value

Dataframe of counts without the low-count genes.

See Also

edgeR

```
## Not run:
    filtered_table <- cbcb_filter_counts(count_table)
## End(Not run)</pre>
```

hpgl_GOplot

hpgl_GOplot

A minor hack of the topGO GOplot function.

Description

This allows me to change the line widths from the default.

Usage

```
hpgl_GOplot(dag, sigNodes, dag.name = "GO terms", edgeTypes = TRUE,
nodeShape.type = c("box", "circle", "ellipse", "plaintext")[3],
genNodes = NULL, wantedNodes = NULL, showEdges = TRUE,
useFullNames = TRUE, oldSigNodes = NULL, nodeInfo = NULL,
maxchars = 30)
```

Arguments

dag DAG tree of ontologies.

sigNodes Set of significant ontologies (with p-values).

dag.name Name for the graph.

edgeTypes Types of the edges for graphviz.

nodeShape.type Shapes on the tree.

genNodes Generate the nodes?

wantedNodes Subset of the ontologies to plot.

showEdges Show the arrows?

useFullNames Full names of the ontologies (they can get long).

oldSigNodes I dunno.
nodeInfo Hmm.

maxchars Maximum characters per line inside the shapes.

Value

Topgo plot!

See Also

topGO

hpgl_GroupDensity 125

groupDensity()

hpgl_GroupDensity	A hack of topGO's
-------------------	-------------------

Description

This just adds a couple wrappers to avoid errors in groupDensity.

Usage

```
hpgl_GroupDensity(object, whichGO, ranks = TRUE, rm.one = FALSE)
```

Arguments

object TopGO enrichment object.

whichGO Individual ontology group to compare against.

ranks Rank order the set of ontologies?

rm.one Remove pvalue=1 groups?

Value

plot of group densities.

hpgl_log2cpm

Converts count matrix to log2 counts-per-million reads.

Description

Based on the method used by limma as described in the Law et al. (2014) voom paper.

Usage

```
hpgl_log2cpm(counts, lib.size = NULL)
```

Arguments

counts Read count matrix.

lib.size Library size.

Value

log2-CPM read count matrix.

See Also

edgeR

hpgl_norm

Examples

```
## Not run:
    12cpm <- hpgl_log2cpm(counts)
## End(Not run)</pre>
```

hpgl_norm

Normalize a dataframe/expt, express it, and/or transform it

Description

There are many possible options to this function. Refer to normalize_expt() for a more complete list.

Usage

```
hpgl_norm(data, ...)
```

Arguments

data Some data as a df/expt/whatever.

... I should put all those other options here

Value

edgeR's DGEList expression of a count table. This seems to me to be the easiest to deal with.

See Also

 $\begin{tabular}{ll} \bf edge R\ DESeq 2\ cpm\ rpkm\ hpgl_rpkm\ DESeq Data Set From Matrix\ estimate Size Factors\ DGE List\ calc Norm Factors \\ \end{tabular}$

hpgl_qshrink 127

hpgl_qshrink $A h$	acked copy of Kwame's qsmooth/qstats code.
--------------------	--

Description

I made a couple small changes to Kwame's qstats() function to make it not fail when on cornercases. I sent him a diff, but haven't checked to see if it was useful yet.

Usage

```
hpgl_qshrink(data = NULL, groups = NULL, refType = "mean",
  groupLoc = "mean", window = 99, groupCol = NULL, plot = TRUE,
  ...)
```

Arguments

data	Count table to modify
groups	Factor of the experimental conditions
refType	Method for grouping conditions
groupLoc	Method for grouping groups
window	Window, for looking!
groupCol	Column to define conditions
plot	Plot the quantiles?
	More options

Value

New data frame of normalized counts

See Also

qsmooth

```
## Not run:
    df <- hpgl_qshrink(data)
## End(Not run)</pre>
```

hpgl_qstats

hpgl_qstats	A hacked copy of Kwame's qsmooth/qstats code.
	** *

Description

I made a couple small changes to Kwame's qstats() function to make it not fail when on cornercases. I sent him a diff, but haven't checked to see if it was useful yet.

Usage

```
hpgl_qstats(data, groups, refType = "mean", groupLoc = "mean",
   window = 99)
```

Arguments

data Initial count data

groups Experimental conditions as a factor.

refType Method to separate groups, mean or median.

groupLoc I don't remember what this is for.

window Window for basking!

Value

Some new data.

See Also

matrixStats

```
## Not run:
  qstatted <- hpgl_qstats(data, conditions)
## End(Not run)</pre>
```

hpgl_rpkm 129

hpgl_rpkm

Reads/(kilobase(gene) * million reads)

Description

Express a data frame of counts as reads per kilobase(gene) per million(library). This function wraps EdgeR's rpkm in an attempt to make sure that the required gene lengths get sent along.

Usage

```
hpgl_rpkm(count_table, ...)
```

Arguments

```
count_table Data frame of counts, alternately an edgeR DGEList.
... extra options including annotations for defining gene lengths.
```

Value

Data frame of counts expressed as rpkm.

See Also

```
edgeR \; \texttt{cpm} \; \texttt{rpkm}
```

Examples

```
## Not run:
    rpkm_df = hpgl_rpkm(df, annotations=gene_annotations)
## End(Not run)
```

hpgl_voom

A slight modification of limma's voom().

Description

Estimate mean-variance relationship between samples and generate 'observational-level weights' in preparation for linear modeling RNAseq data. This particular implementation was primarily scabbed from cbcbSEQ, but changes the mean-variance plot slightly and attempts to handle corner cases where the sample design is confounded by setting the coefficient to 1 for those samples rather than throwing an unhelpful error. Also, the Elist output gets a 'plot' slot which contains the plot rather than just printing it.

hpgl_voomweighted

Usage

```
hpgl_voom(dataframe, model = NULL, libsize = NULL,
  normalize.method = "none", span = 0.5, stupid = FALSE,
  logged = FALSE, converted = FALSE, ...)
```

Arguments

dataframe Dataframe of sample counts which have been normalized and log transformed.

model Experimental model defining batches/conditions/etc.

libsize Size of the libraries (usually provided by edgeR).

normalize.method

Normalization method used in voom().

span The span used in voom().

stupid Cheat when the resulting matrix is not solvable?

logged Is the input data is known to be logged?

converted Is the input data is known to be cpm converted?

... Extra arguments are passed to arglist.

Value

EList containing the following information: E = The normalized data weights = The weights of said data design = The resulting design lib.size = The size in pseudocounts of the library plot = A ggplot of the mean/variance trend with a blue loess fit and red trend fit

See Also

limma ggplot2

Examples

```
## Not run:
  funkytown = hpgl_voom(samples, model)
## End(Not run)
```

hpgl_voomweighted

A minor change to limma's voom with quality weights to attempt to address some corner cases.

Description

This copies the logic employed in hpgl_voom(). I suspect one should not use it.

hpgl_voomweighted 131

Usage

```
hpgl_voomweighted(data, fun_model, libsize = NULL,
  normalize.method = "none", plot = TRUE, span = 0.5,
  var.design = NULL, method = "genebygene", maxiter = 50,
  tol = 1e-10, trace = FALSE, replace.weights = TRUE, col = NULL,
  ...)
```

Arguments

data Some data!

fun_model A model for voom() and arrayWeights()

libsize Library sizes passed to voom().

normalize.method

Passed to voom()

plot Do the plot of mean variance?

span yes
var.design maybe
method kitty!
maxiter 50 is good

tol I have no tolerance.

trace no trace for you.

replace.weights

Replace the weights?

col yay columns!
... more arguments!

Value

a voom return

See Also

limma

```
## Not run:
## No seriously, dont run this, I think it is wiser to use the functions
## provided by limma. But this provides a place to test stuff out.
voom_result <- hpgl_voomweighted(dataset, model)
## End(Not run)</pre>
```

intersect_signatures

```
install_packrat_globally
```

Install the set of local packrat packages so everyone may use them!

Description

Install the set of local packrat packages so everyone may use them!

Usage

```
install_packrat_globally()
```

intersect_signatures

Take a result from simple_gsva(), a list of gene IDs, and intersect them.

Description

Najib is curious about the relationship of genes in sets, the sets, and the genes that comprise those sets. This is pushing gsva towards a oroborous-ish state.

Usage

```
intersect_signatures(gsva_result, lst, freq_cutoff = 2,
    sig_weights = TRUE, gene_weights = TRUE)
```

Arguments

gsva_result Result from simple_gsva().

1st List of genes of interest.

freq_cutoff Minimum number of observations to be counted.
sig_weights When making venn diagrams, weight them?

gene_weights When venning genes, weight them?

Value

List containing some venns, lists, and such.

intersect_significant 133

intersect_significant Find the sets of intersecting significant genes

Description

Use extract_significant_genes() to find the points of agreement between limma/deseq/edger.

Usage

```
intersect_significant(combined, lfc = 1, p = 0.05, padding_rows = 2,
  z = NULL, p_type = "adj", selectors = c("limma", "deseq", "edger"),
  order = "inverse", excel = "excel/intersect_significant.xlsx", ...)
```

Arguments

combined A result from combine_de_tables().

1fc Define significant via fold-change.

p Or p-value.

padding_rows How much space to put between groups of data?

z Use a z-score filter?

p_type Use normal or adjusted p-values. selectors List of methods to intersect.

order Low-to-high or vice-versa for returning log-fc vales.

excel An optional excel workbook to which to write.

... Extra arguments for extract_significant_genes() and friends.

Description

This function seeks to reformat data from KEGGREST into something which is rather easier to use.

Usage

```
kegg_vector_to_df(vector, final_colname = "first", flatten = TRUE)
```

Arguments

vector Information from KEGGREST

final_colname Column name for the new information

flatten Flatten nested data?

limma_pairwise

Details

This could probably benefit from a tidyr-ish revisitation.

Value

A normalized data frame of gene IDs to whatever.

Author(s)

atb

limma_pairwise	Set up a model matrix and set of contrasts for pairwise comparisons
	using voom/limma.

Description

Creates the set of all possible contrasts and performs them using voom/limma.

Usage

```
limma_pairwise(input = NULL, conditions = NULL, batches = NULL,
  model_cond = TRUE, model_batch = TRUE, model_intercept = FALSE,
  alt_model = NULL, extra_contrasts = NULL, annot_df = NULL,
  libsize = NULL, force = FALSE, ...)
```

Arguments

9		
input	Dataframe/vector or expt class containing count tables, normalization state, etc.	
conditions	Factor of conditions in the experiment.	
batches	Factor of batches in the experiment.	
model_cond	Include condition in the model?	
model_batch	Include batch in the model? This is hopefully TRUE.	
model_intercept		
	Perform a cell-means or intercept model? A little more difficult for me to un-	
	derstand. I have tested and get the same answer either way.	
alt_model	Separate model matrix instead of the normal condition/batch.	
extra_contrasts		
	Some extra contrasts to add to the list. This can be pretty neat, lets say one has conditions A,B,C,D,E and wants to do (C/B)/A and (E/D)/A or (E/D)/(C/B) then use this with a string like: "c_vs_b_ctrla = (C-B)-A, e_vs_d_ctrla = (E-D)-A, de_vs_cb = (E-D)-(C-B),"	
annot_df	Data frame for annotations.	
libsize	I've recently figured out that libsize is far more important than I previously realized. Play with it here.	
force	Force data which may not be appropriate for limma into it?	

Use the elipsis parameter to feed options to write_limma().

loadme 135

Value

List including the following information: macb = the mashing together of condition/batch so you can look at it macb_model = The result of calling model.matrix(~0 + macb) macb_fit = The result of calling lmFit(data, macb_model) voom_result = The result from voom() voom_design = The design from voom (redundant from voom_result, but convenient) macb_table = A table of the number of times each condition/batch pairing happens cond_table = A table of the number of times each condition appears (the denominator for the identities) batch_table = How many times each batch appears identities = The list of strings defining each condition by itself all_pairwise = The list of strings defining all the pairwise contrasts contrast_string = The string making up the make-Contrasts() call pairwise_fits = The result from calling contrasts.fit() pairwise_comparisons = The result from eBayes() limma_result = The result from calling write_limma()

See Also

```
limma Biobase write_limma
```

Examples

```
## Not run:
    pretend <- limma_pairwise(expt)
## End(Not run)</pre>
```

loadme

Load a backup rdata file

Description

I often use R over a sshfs connection, sometimes with significant latency, and I want to be able to save/load my R sessions relatively quickly. Thus this function uses my backup directory to load its R environment.

Usage

```
loadme(directory = "savefiles", filename = "Rdata.rda.xz")
```

Arguments

directory Directory containing the RData.rda.xz file.

filename Filename to which to save.

Value

a bigger global environment

See Also

```
saveme load save
```

Examples

```
## Not run:
  loadme()
## End(Not run)
```

load_annotations

*Use one of the load_*_annotations() functions to gather annotation data.*

Description

We should be able to have an agnostic annotation loader which can take some standard arguments and figure out where to gather data on its own.

Usage

```
load_annotations(type = NULL, ...)
```

Arguments

type

Explicitly state the type of annotation data to load. If not provided, try to figure

it out automagically.

... Arguments passed to the other load_*_annotations().

Value

Some annotations, hopefully.

Author(s)

atb

load_biomart_annotations

Extract annotation information from biomart.

Description

Biomart is an amazing resource of information, but using it is a bit annoying. This function hopes to alleviate some common headaches.

Usage

```
load_biomart_annotations(species = "hsapiens", overwrite = FALSE,
  do_save = TRUE, host = "dec2016.archive.ensembl.org",
  drop_haplotypes = TRUE, trymart = "ENSEMBL_MART_ENSEMBL",
  trydataset = NULL, gene_requests = c("ensembl_gene_id", "version",
  "ensembl_transcript_id", "transcript_version", "hgnc_symbol",
  "description", "gene_biotype"),
  length_requests = c("ensembl_transcript_id", "cds_length",
  "chromosome_name", "strand", "start_position", "end_position"),
  include_lengths = TRUE)
```

Arguments

species Choose a species.

overwrite Overwite an existing save file?

do_save Create a savefile of annotations for future runs?

host Ensembl hostname to use.

drop_haplotypes

Some chromosomes have stupid names because they are from non-standard hap-

lotypes and they should go away. Setting this to false stops that.

trymart Biomart has become a circular dependency, this makes me sad, now to list the

marts, you need to have a mart loaded.

trydataset Choose the biomart dataset from which to query.

gene_requests Set of columns to query for description-ish annotations.

length_requests

Set of columns to query for location-ish annotations.

include_lengths

Also perform a search on structural elements in the genome?

Details

Tested in test_40ann_biomart.R This goes to some lengths to find the relevant tables in biomart. But biomart is incredibly complex and one should carefully inspect the output if it fails to see if there are more appropriate marts, datasets, and columns to download.

Value

List containing: a data frame of the found annotations, a copy of the mart instance to help with finding problems, the hostname queried, the name of the mart queried, a vector of rows queried, vector of the available attributes, and the ensembl dataset queried.

Author(s)

atb

See Also

biomaRt listDatasets getBM

138 load_biomart_go

Examples

```
## Not run:
   tt = get_biomart_annotations()
## End(Not run)
```

load_biomart_go

Extract gene ontology information from biomart.

Description

I perceive that every time I go to acquire annotation data from biomart, they have changed something important and made it more difficult for me to find what I want. I recently found the *.archive.ensembl.org, and so this function uses that to try to keep things predictable, if not consistent.

Usage

```
load_biomart_go(species = "hsapiens", overwrite = FALSE,
  do_save = TRUE, host = "dec2015.archive.ensembl.org",
  trymart = "ENSEMBL_MART_ENSEMBL", secondtry = "_gene",
  dl_rows = c("ensembl_gene_id", "go_accession"),
  dl_rowsv2 = c("ensembl_gene_id", "go_id"))
```

Arguments

species Species to query.

overwrite Overwrite existing savefile?

do_save Create a savefile of the annotations? (if not false, then a filename.)

host Ensembl hostname to use.

trymart Default mart to try, newer marts use a different notation.

secondtry The newer mart name.

dl_rows List of rows from the final biomart object to download.

dl_rowsv2 A second list of potential rows.

Details

Tested in test_40ann_biomart.R This function makes a couple of attempts to pick up the correct tables from biomart. It is worth noting that it uses the archive.ensembl host(s) because of changes in table organization after December 2015 as well as an attempt to keep the annotation sets relatively consistent.

Value

List containing the following: data frame of ontology data, a copy of the biomart instance for further querying, the host queried, the biomart queried, a vector providing the attributes queried, and the ensembl dataset queried.

Author(s)

atb

See Also

biomaRt listMarts useDataset getBM

Examples

```
## Not run:
   tt = get_biomart_ontologies()
## End(Not run)
```

load_biomart_orthologs

Use biomart to get orthologs between supported species.

Description

Biomart's function getLDS is incredibly powerful, but it makes me think very polite people are going to start knocking on my door, and it fails weirdly pretty much always. This function attempts to alleviate some of that frustration.

Usage

```
load_biomart_orthologs(gene_ids, first_species = "hsapiens",
  second_species = "mmusculus", host = "dec2016.archive.ensembl.org",
  trymart = "ENSEMBL_MART_ENSEMBL", attributes = "ensembl_gene_id")
```

Arguments

first_species Linnean species name for one species.

second_species Linnean species name for the second species.

host Ensembl server to query.
trymart Assumed mart name to use.

attributes Key to query

Details

Tested in test_40ann_biomart.R As with my other biomart functions, this one grew out of frustrations when attempting to work with the incredibly unforgiving biomart service. It does not attempt to guarantee a useful biomart connection, but will hopefully point out potentially correct marts and attributes to use for a successful query. I can say with confidence that it works well between mice and humans.

Value

list of 4 elements: The first is the set of all ids, as getLDS seems to always send them all; the second is the subset corresponding to the actual ids of interest, and the 3rd/4th are other, optional ids from other datasets.

Author(s)

atb

See Also

biomaRt getLDS useMart

Examples

load_genbank_annotations

Given a genbank accession, make a txDb object along with sequences, etc

Description

Let us admit it, sometimes biomart is a pain. It also does not have easily accessible data for microbes. Genbank does!

Usage

```
load_genbank_annotations(accession = "AE009949", reread = TRUE,
  savetxdb = FALSE)
```

Arguments

accession Accession to download and import

reread Re-read (download) the file from genbank

savetxdb Attempt saving a txdb object?

Details

Tested in test_40ann_biomartgenbank.R and test_70expt_spyogenes.R This primarily sets some defaults for the genbankr service in order to facilitate downloading genomes from genbank and dumping them into a local txdb instance.

load_gff_annotations 141

Value

List containing a txDb, sequences, and some other stuff which I haven't yet finalized.

Author(s)

atb

See Also

```
genbankr rentrez import
```

Examples

```
## Not run:
   txdb_result <- load_genbank_annotations(accession="AE009948", savetxdb=TRUE)
## End(Not run)</pre>
```

Description

Try to make import.gff a little more robust; I acquire (hopefully) valid gff files from various sources: yeastgenome.org, microbesonline, tritrypdb, ucsc, ncbi. To my eyes, they all look like reasonably good gff3 files, but some of them must be loaded with import.gff2, import.gff3, etc. That is super annoying. Also, I pretty much always just do as.data.frame() when I get something valid from rtracklayer, so this does that for me, I have another function which returns the iranges etc. This function wraps import.gff/import.gff3/import.gff2 calls in try() because sometimes those functions fail in unpredictable ways.

Usage

```
load_gff_annotations(gff, type = NULL, id_col = "ID",
  ret_type = "data.frame", second_id_col = "locus_tag", try = NULL,
  row.names = NULL)
```

Arguments

gff	Gff filename.
5 I I	OII IIICIIaiiic.

type Subset the gff file for entries of a specific type.

id_col Column in a successful import containing the IDs of interest.

ret_type Return a data.frame or something else?

second_id_col Second column to check.

try Give your own function call to use for importing.

row.names Choose another column for setting the rownames of the data frame.

Value

Dataframe of the annotation information found in the gff file.

Author(s)

atb

See Also

```
rtracklayer GenomicRanges import.gff
```

Examples

```
## Not run:
  funkytown <- load_gff_annotations('reference/gff/saccharomyces_cerevsiae.gff.xz')
## End(Not run)</pre>
```

load_kegg_annotations Create a data frame of pathways to gene IDs from KEGGREST

Description

This seeks to take the peculiar format from KEGGREST for pathway<->genes and make it easier to deal with.

Usage

```
load_kegg_annotations(species = "coli", abbreviation = NULL,
  flatten = TRUE)
```

Arguments

species String to use to query KEGG abbreviation.

abbreviation If you already know the abbreviation, use it.

flatten Flatten nested tables?

Value

dataframe with rows of KEGG gene IDs and columns of NCBI gene IDs and KEGG paths.

Author(s)

atb

load_microbesonline_annotations

Skip the db and download all the text annotations for a given species.

Description

The microbesonline publicly available mysqldb is rather more complex than I prefer. This skips that process and just grabs a tsv copy of everything and loads it into a dataframe. I have not yet figured out how to so-easily query microbesonline for species IDs, thus one will have to manually query the database to find species of interest.

Usage

```
load_microbesonline_annotations(id = "160490")
```

Arguments

id

Microbesonline ID to query.

Details

Tested in test_70expt_spyogenes.R There is so much awesome information in microbesonline, but damn is it annoying to download. This function makes that rather easier, or so I hope at least.

Value

Dataframe containing the annotation information.

Author(s)

atb

See Also

RCurl getURL

```
## Not run:
   annotations <- get_microbesonline_annotation(ids=c("160490","160491"))
## End(Not run)</pre>
```

load_microbesonline_go

Extract the set of GO categories by microbesonline locus

Description

The microbesonline is such a fantastic resource, it is a bit of a shame that it is such a pain to query.

Usage

```
load_microbesonline_go(id = "160490", id_column = "name",
  data_column = "GO", name = NULL)
```

Arguments

id Which species to query.

id_column This no longer uses MySQL, so which column from the html table to pull?

data_column Similar to above, there are lots of places from which one might extract the data.

name Allowing for non-specific searches by species name.

Details

Tested in test_42ann_microbes.R I am not 100 ontology accessions. At the very least, it does return a large number of them, which is a start.

Value

data frame of GO terms from www.microbesonline.org

Author(s)

atb

```
## Not run:
    go_df <- get_loci_go(id="160490")
## End(Not run)</pre>
```

load_orgdb_annotations

Load organism annotation data from an orgdb sqlite package.

Description

Creates a dataframe gene and transcript information for a given set of gene ids using the AnnotationDbi interface.

Usage

```
load_orgdb_annotations(orgdb = NULL, gene_ids = NULL,
  include_go = FALSE, keytype = "ensembl",
  strand_column = "cdsstrand", start_column = "cdsstart",
  end_column = "cdsend", chromosome_column = "cdschrom",
  type_column = "gene_type", name_column = "cdsname", fields = NULL,
  sum_exon_widths = FALSE)
```

Arguments

orgdb OrganismDb instance.

gene_ids Search for a specific set of genes?

include_go Ask the Dbi for gene ontology information?

keytype mmm the key type used?

strand_column There are a few fields I want to gather by default: start, end, strand, chromosome,

type, and name; but these do not necessarily have consistent names, use this

column for the chromosome strand.

start_column Use this column for the gene start.
end_column Use this column for the gene end.

chromosome_column

Use this column to identify the chromosome.

type_column Use this column to identify the gene type.

name_column Use this column to identify the gene name.

fields Columns included in the output.

sum_exon_widths

Perform a sum of the exons in the data set?

Details

Tested in test_45ann_organdb.R This defaults to a few fields which I have found most useful, but the brave or pathological can pass it 'all'.

Value

Table of geneids, chromosomes, descriptions, strands, types, and lengths.

load_orgdb_go

Author(s)

atb

See Also

AnnotationDbi GenomicFeatures BiocGenerics columns keytypes select exonsBy

Examples

```
## Not run:
  one_gene <- load_orgdb_annotations(org, c("LmJF.01.0010"))
## End(Not run)</pre>
```

load_orgdb_go

Retrieve GO terms associated with a set of genes.

Description

AnnotationDbi provides a reasonably complete set of GO mappings between gene ID and ontologies. This will extract that table for a given set of gene IDs.

Usage

```
load_orgdb_go(orgdb = NULL, gene_ids = NULL, keytype = "ensembl",
  columns = c("go", "goall", "goid"))
```

Arguments

orgdb OrganismDb instance.

keytype The mysterious keytype returns yet again to haunt my dreams.

columns The set of columns to request.

Details

Tested in test_45ann_organdb.R This is a nice way to extract GO data primarily because the Orgdb data sets are extremely fast and flexible, thus by changing the keytype argument, one may use a lot of different ID types and still score some useful ontology data.

Value

Data frame of gene IDs, go terms, and names.

Author(s)

I think Keith provided the initial implementation of this, but atb messed with it pretty extensively.

See Also

AnnotationDbi GO.db magrittr select tbl_df

Examples

```
## Not run:
   go_terms <- load_go_terms(org, c("a","b"))
## End(Not run)</pre>
```

load_parasite_annotations

I see no reason to have load_host_annotations and load_parasite_annotations.

Description

Thus I am making them both into aliases to load_annotations.

Usage

```
load_parasite_annotations(...)
```

Arguments

... Arguments to be passed to load_annotations.

load_trinotate_annotations

Read a csv file from trinotate and make an annotation data frame.

Description

Trinotate performs some neat sequence searches in order to seek out likely annotations for the trinity contigs. The resulting csv file is encoded in a peculiar fashion, so this function attempts to make it easier to read and put them into a format usable in an expressionset.

Usage

```
load_trinotate_annotations(trinotate = "reference/trinotate.csv")
```

Arguments

trinotate CSV

CSV of trinotate annotation data.

load_trinotate_go

Value

Dataframe of fun data.

Author(s)

atb

Examples

```
## Not run:
    annotation_dt <- load_trinotate_annotations("reference/trinotate.csv.xz")
    expt <- create_expt(metadata=metadata.xlsx, gene_info=annotation_dt)
## End(Not run)</pre>
```

load_trinotate_go

Read a csv file from trinotate and extract ontology data from it.

Description

Trinotate performs some neat sequence searches in order to seek out likely annotations for the trinity contigs. This function extracts ontology data from it. Keep in mind that this data is primarily from Blast2GO.

Usage

```
load_trinotate_go(trinotate = "reference/trinotate.csv")
```

Arguments

trinotate

CSV of trinotate annotation data.

Value

List of the extracted GO data, a table of it, length data, and the resulting length table.

Author(s)

atb

```
## Not run:
    go_lst <- load_trinotate_go("trinotate.csv.xz")
## End(Not run)</pre>
```

load_uniprotws_annotations

Extract annotation data from the uniprot webservices.

Description

I keep thinking that this is in fact querying NCBI, but I think that is incorrect. This is because all of the examples are using ENTREZ_GENE as the primary key I bet. In any event, this function seeks to simplify getting useful annotation from UniProt.ws by filling in some of the arguments and hopefully telling the user when things do not go according to plan.

Usage

```
load_uniprotws_annotations(id = NULL,
   species = "Mycobacterium tuberculosis", keytype = "GI_NUMBER*",
   chosen_columns = NULL)
```

Arguments

id Species ID, if not provided, then this will try to find it using the species

species Assuming no ID, use this to find one.

keytype The primary keytype when doing the final select statement.

chosen_columns What columns are desired from the webservices data? If not provided, this will

attempt to choose useful ones.

Value

Data frame from selecting the hopefully appropriate columns with AnnotationDbi.

load_uniprot_annotations

Read a uniprot text file and extract as much information from it as possible.

Description

I spent entirely too long fighting with Uniprot.ws, finally got mad and wrote this.

Usage

```
load_uniprot_annotations(file = NULL, savefile = TRUE)
```

Arguments

file Uniprot file to read and parse

savefile Do a save?

make_3d_pca

Value

Big dataframe of annotation data.

local_get_value

Perform a get_value for delimited files

Description

Keith wrote this as .get_value() but functions which start with . trouble me.

Usage

```
local_get_value(x, delimiter = ": ")
```

Arguments

x Some stuff to split

delimiter The tritrypdb uses ': ' ergo the default.

Value

A value!

make_3d_pca

Something silly for Najib.

Description

This will make him very happy, but I remain skeptical.

Usage

```
make_3d_pca(pc_result, components = c(1, 2, 3), file = "3dpca.html")
```

Arguments

components List of three axes by component.

file File to write the created plotly object.

Description

Since we go to the trouble to try and generate nice orgdb/txdb/organismdbi packages, it seems to me that we ought to also be able to make a readable genome package. I should probably use some of the logic from this to make the organismdbi generator smarter.

Usage

```
make_eupath_bsgenome(species = "Leishmania major strain Friedlin",
  entry = NULL, version = NULL, dir = "eupathdb",
  reinstall = FALSE, metadata = NULL, ...)
```

Arguments

species Species to create.

entry Single eupathdb metadata entry.

version Which version of the eupathdb to use for creating the BSGenome?

dir Working directory.

reinstall Rewrite an existing package directory.

metadata Eupathdb metadata dataframe.

... Extra arguments for downloading metadata when not provided.

Value

List of package names generated (only 1).

Author(s)

atb

make_eupath_organismdbi

Create an organismDbi instance for an eupathdb organism.

Description

The primary goal of an organismdbi instance is to provide a series of links between an orgdb, txdb, and other relevant annotation packages (reactome/go/etc). In its current iteration, this function brings together a couple columns from the orgdb, txdb, GO.db, and reactome.db.

152 make_eupath_orgdb

Usage

```
make_eupath_organismdbi(species = "Leishmania major strain Friedlin",
  entry = NULL, version = NULL, dir = "eupathdb",
  reinstall = FALSE, metadata = NULL, kegg_abbreviation = NULL,
  exclude_join = "ENTREZID", ...)
```

Arguments

species A species in the eupathDb metadata.

entry A row from the eupathdb metadataframe.

version Which version of the eupathdb to use for creating this package?

dir Directory in which to build the packages.

reinstall Overwrite existing data files?

metadata Use a pre-existing metadata table, or download a new one.

kegg_abbreviation

For when we cannot automagically find the kegg species id.

exclude_join I had a harebrained idea to automatically set up the joins between columns of

GO.db/reactome.db/orgdb/txdb objects. This variable is intended to exclude columns with common IDs that might multi-match spuriously – I think in the end I killed the idea though, perhaps this should be removed or resurrected.

... Extra arguments when downloading metadata.

Value

The result of attempting to install the organismDbi package.

Author(s)

Keith Hughitt, modified by atb.

make_eupath_orgdb

Create an orgdb SQLite database from the tables in eupathdb.

Description

This function has passed through multiple iterations as the preferred method(s) for accessing data in the eupathdb has changed. It currently uses my empirically defined set of queries against the eupathdb webservices. As a result, I have made some admittedly bizarre choices when creating the queries. Check through eupath_webservices.r for some amusing examples of how I have gotten around the idiosyncrasies in the eupathdb.

Usage

```
make_eupath_orgdb(species = NULL, entry = NULL, dir = "eupathdb",
  version = NULL, kegg_abbreviation = NULL, reinstall = FALSE,
  metadata = NULL, ...)
```

make_eupath_txdb 153

Arguments

species A specific species ID to query

entry If not provided, then species will get this, it contains all the information.

dir Where to put all the various temporary files.

version Which version of the eupathdb to use for creating this package?

kegg_abbreviation

If known, provide the kegg abbreviation.

reinstall Re-install an already existing orgdb?

metadata Use an existing metadata table to get the entry?
... Extra parameters when searching for metadata

Value

Currently only the name of the installed package. This should probably change.

Author(s)

Keith Hughitt with significant modifications by atb.

make_eupath_txdb Gen

Generate TxDb for EuPathDB organism

Description

Generate TxDb for EuPathDB organism

Usage

```
make_eupath_txdb(species = NULL, entry = NULL, dir = "eupathdb",
  version = NULL, reinstall = FALSE, metadata = NULL, ...)
```

Arguments

species Species name from the eupathdb metadata.
entry One row from the organism metadata.
dir Base directory for building the package.

version Which version of the eupathdb to use for creating this package?

reinstall Overwrite an existing installed package?

metadata dataframe of eupathdb metadata.
... Extra arguments for getting metadata.

Value

TxDb instance name.

make_exampledata

Author(s)

Keith Hughitt with significant modifications by atb.

make_exampledata

Small hack of limma's exampleData() to allow for arbitrary data set sizes.

Description

exampleData has a set number of genes/samples it creates. This relaxes that restriction.

Usage

```
make_exampledata(ngenes = 1000, columns = 5)
```

Arguments

ngenes How many genes in the fictional data set?

columns How many samples in this data set?

Value

Matrix of pretend counts.

See Also

limma stats DESeq

```
## Not run:
    pretend = make_exampledata()
## End(Not run)
```

```
make_gsc_from_abundant
```

Given a pairwise result, make a gene set collection.

Description

If I want to play with gsva and friends, then I need GeneSetCollections! Much like make_gsc_from_significant(), this function extract the genes deemed 'abundant' and generates gene sets accordingly.

Usage

```
make_gsc_from_abundant(pairwise, according_to = "deseq",
  orgdb = "org.Hs.eg.db", researcher_name = "elsayed",
  study_name = "macrophage", category_name = "infection",
  phenotype_name = NULL, pair_names = "high", current_id = "ENSEMBL",
  required_id = "ENTREZID", ...)
```

Arguments

A pairwise result, or combined de result, or extracted genes. pairwise When getting significant genes, use this method. according_to Annotation dataset. orgdb researcher_name Prefix of the name for the generated set(s). Second element in the name of the generated set(s). study_name Third element in the name of the generated set(s). category_name Optional phenotype data for the generated set(s). phenotype_name The suffix of the generated set(s). pair_names What type of ID is the data currently using? current_id

Extra arguments for extract_abundant_genes().

What type of ID should the use?

Value

. . .

required_id

List containing 3 GSCs, one containing both the highs/lows called 'colored', one of the highs, and one of the lows.

make_gsc_from_ids

make_gsc_from_ids

Create a gene set collection from a set of arbitrary IDs.

Description

This function attempts to simplify the creation of a gsva compatible GeneSet. Some important caveats when working with gsva, notably the gene IDs we use are not usually compatible with the gene IDs used by gsva, thus the primary logic in this function is intended to bridge these IDs.

Usage

```
make_gsc_from_ids(first_ids, second_ids = NULL, orgdb = "org.Hs.eg.db",
  researcher_name = "elsayed", study_name = "macrophage",
  category_name = "infection", phenotype_name = NULL,
  pair_names = "up", current_id = "ENSEMBL",
  required_id = "ENTREZID")
```

Arguments

first_ids The required IDs for a single set.

second_ids Potentially null optionally used for a second, presumably contrasting set.

orgdb Orgdb annotation, used to translate IDs to the required type.

researcher_name

Prefix of the name for the generated set(s).

 $\label{eq:study_name} Second \ element \ in \ the \ name \ of \ the \ generated \ set(s).$

 ${\tt category_name} \quad \text{Third element in the name of the generated } {\sf set}(s).$

phenotype_name Optional phenotype data for the generated set(s).

pair_names The suffix of the generated set(s).

current_id What type of ID is the data currently using?

required_id What type of ID should the use?

Value

Small list comprised of the created gene set collection(s).

```
make_gsc_from_pairwise
```

Given a pairwise result, make a gene set collection.

Description

If I want to play with gsva and friends, then I need GeneSetCollections! To that end, this function uses extract_significant_genes() in order to gather sets of genes deemed 'significant'. It then passes these sets to make_gsc_from_ids().

Usage

```
make_gsc_from_pairwise(pairwise, according_to = "deseq",
  orgdb = "org.Hs.eg.db", pair_names = c("ups", "downs"),
  category_name = "infection", phenotype_name = "parasite",
  set_name = "elsayed_macrophage", color = TRUE,
  current_id = "ENSEMBL", required_id = "ENTREZID", ...)
```

Arguments

pairwise A pairwise result, or combined de result, or extracted genes.

according_to When getting significant genes, use this method.

orgdb Annotation dataset.

pair_names Describe the contrasts of the GSC: up vs. down, high vs. low, etc.

category_name What category does the GSC describe?

phenotype_name When making color sets, use this phenotype name.

set_name A name for the created gene set.

color Make a colorSet?

current_id Usually we use ensembl IDs, but that does not _need_ to be the case.

required_id gsva uses entrezids by default.

... Extra arguments for extract_significant_genes().

Value

List containing 3 GSCs, one containing both the ups/downs called 'colored', one of the ups, and one of the downs.

158 make_limma_tables

make_id2gomap

Make a go mapping from IDs in a format suitable for topGO.

Description

When using a non-supported organism, one must write out mappings in the format expected by topgo. This handles that process and gives a summary of the new table.

Usage

```
make_id2gomap(goid_map = "reference/go/id2go.map", go_db = NULL,
   overwrite = FALSE)
```

Arguments

goid_map TopGO mapping file.

go_db If there is no goid_map, create it with this data frame.

overwrite Rewrite the mapping file?

Value

Summary of the new goid table.

See Also

topGO

make_limma_tables

Writes out the results of a limma search using toptable().

Description

However, this will do a couple of things to make one's life easier: 1. Make a list of the output, one element for each comparison of the contrast matrix 2. Write out the toptable() output in separate .csv files and/or sheets in excel 3. Since I have been using qvalues a lot for other stuff, add a column for them.

Usage

```
make_limma_tables(fit = NULL, adjust = "BH", n = 0, coef = NULL,
  annot_df = NULL, intercept = FALSE)
```

Arguments

fit Result from lmFit()/eBayes() adjust Pvalue adjustment chosen.

n Number of entries to report, 0 says do them all.

coef Which coefficients/contrasts to report, NULL says do them all.

annot_df Optional data frame including annotation information to include with the tables.

intercept Intercept model?

Value

List of data frames comprising the toptable output for each coefficient, I also added a qualue entry to these toptable() outputs.

See Also

```
limma qvalue write_xls topTable
```

Examples

```
## Not run:
    finished_comparison = eBayes(limma_output)
    table = make_limma_tables(finished_comparison, adjust="fdr")
## End(Not run)
```

make_pairwise_contrasts

Run makeContrasts() with all pairwise comparisons.

Description

In order to have uniformly consistent pairwise contrasts, I decided to avoid potential human erors(sic) by having a function generate all contrasts.

Usage

```
make_pairwise_contrasts(model, conditions, do_identities = FALSE,
  do_pairwise = TRUE, extra_contrasts = NULL, ...)
```

Arguments

model Describe the conditions/batches/etc in the experiment.

conditions Factor of conditions in the experiment.

can not.

160 make_pombe_expt

```
do_pairwise Include all pairwise strings? This shouldn't need to be set to FALSE, but just in case.

extra_contrasts

Optional string of extra contrasts to include.

Extra arguments passed here are caught by arglist.
```

Details

Invoked by the _pairwise() functions.

Value

List including the following information:

- 1. all_pairwise_contrasts = the result from makeContrasts(...)
- 2. identities = the string identifying each condition alone
- 3. all_pairwise = the string identifying each pairwise comparison alone
- 4. contrast_string = the string passed to R to call makeContrasts(...)
- 5. names = the names given to the identities/contrasts

See Also

```
limma makeContrasts
```

Examples

```
## Not run:
    pretend <- make_pairwise_contrasts(model, conditions)
## End(Not run)</pre>
```

make_pombe_expt

Create a Schizosaccharomyces cerevisiae expt.

Description

This just saves some annoying typing if one wishes to make a standard expressionset superclass out of the publicly available fission data set.

Usage

```
make_pombe_expt(annotation = TRUE)
```

Arguments

annotation

Add annotation data?

Value

Expressionset/expt of fission.

make_simplified_contrast_matrix

Create a contrast matrix suitable for MSstats and similar tools.

Description

I rather like makeContrasts() from limma. I troubled me to have to manually create a contrast matrix when using MSstats. It turns out it troubled me for good reason because I managed to reverse the terms and end up with the opposite contrasts of what I intended. Ergo this function.

Usage

```
make_simplified_contrast_matrix(numerators, denominators)
```

Arguments

numerators Character list of conditions which are the numerators of a series of a/b compar-

isons

denominators Character list of conditions which are the denominators of a series of a/b com-

parisons.

Details

Feed make_simplified_contrast_matrix() a series of numerators and denominators names after the conditions of interest in an experiment and it returns a contrast matrix in a format acceptable to MSstats.

Value

Contrast matrix

make_taxon_names

Iterate through the various ways of representing taxon names

Description

Spend some time making sure they are valid, too. Thus we want to get rid of weird characters like hash marks, pipes, etc.

Usage

```
make_taxon_names(entry)
```

Arguments

entry

An entry of the eupathdb metadata.

map_kegg_dbs

Value

A list of hopefully valid nomenclature names to be used elsewhere in this family.

Author(s)

atb

map_kegg_dbs

Maps KEGG identifiers to ENSEMBL gene ids.

Description

Takes a list of KEGG gene identifiers and returns a list of ENSEMBL ids corresponding to those genes.

Usage

```
map_kegg_dbs(kegg_ids)
```

Arguments

kegg_ids

List of KEGG identifiers to be mapped.

Value

Ensembl IDs as a character list.

See Also

```
KEGGREST keggGet
```

```
## Not run:
ensembl_list <- kegg_to_ensembl("a")
## End(Not run)</pre>
```

map_orgdb_ids 163

ma	n	٥r	ď	dh	١ i	ds
IIIa	ν_	U	೫	uu		us

Map AnnotationDbi keys from one column to another.

Description

Given a couple of keytypes, this provides a quick mapping across them. I might have an alternate version of this hiding in the gsva code, which requires ENTREZIDs. In the mean time, this creates a dataframe of the mapped columns for a given set of gene ids using the in a sqlite instance.

Usage

```
map_orgdb_ids(orgdb, gene_ids = NULL, mapto = c("ensembl"),
   keytype = "geneid")
```

Arguments

orgdb OrganismDb instance.

gene_ids Gene identifiers for retrieving annotations.

mapto Key to map the IDs against.

keytype Choose a keytype, this will yell if it doesn't like your choice.

Value

a table of gene information

Author(s)

Keith Hughitt with changes by atb.

See Also

AnnotationDbi select keytypes

```
## Not run:
host <- map_orgdb_ids(org, c("a","b"))
## End(Not run)</pre>
```

164 median_by_factor

median_by_factor	Create a data frame of the medians of rows by a given factor in the data.
------------------	---

Description

This assumes of course that (like expressionsets) there are separate columns for each replicate of the conditions. This will just iterate through the levels of a factor describing the columns, extract them, calculate the median, and add that as a new column in a separate data frame.

Usage

```
median_by_factor(data, fact = "condition")
```

Arguments

data Data frame, presumably of counts.

fact Factor describing the columns in the data.

Details

Used in write_expt() as well as a few random collaborations.

Value

Data frame of the medians.

See Also

Biobase matrixStats

```
## Not run:
  compressed = median_by_factor(data, experiment$condition)
## End(Not run)
```

model_test 165

mod	el	test	

Make sure a given experimental factor and design will play together.

Description

Have you ever wanted to set up a differential expression analysis and after minutes of the computer churning away it errors out with some weird error about rank? Then this is the function for you!

Usage

```
model_test(design, goal = "condition", factors = NULL, ...)
```

Arguments

design	Dataframe describing the design of the experiment.
goal	Experimental factor you actually want to learn about.
factors	Experimental factors you rather wish would just go away.
	I might decide to add more options from other functions.

Value

List of booleans telling if the factors + goal will work.

See Also

```
model.matrix qr
```

 ${\it myretrieve} KGML$

A couple functions from KEGGgraph that have broken

Description

Some material in KEGGREST is borken.

Usage

```
myretrieveKGML(pathway, organism, destfile, silent = TRUE,
   hostname = "http://www.kegg.jp", ...)
```

Arguments

pathway The path to query.

organism Which organism to query?

destfile File to which to download.

silent Send stdout and stderr to dev null?

hostname Host to download from (this is what is broken.)

... Arglist!

my_identifyAUBlocks

copy/paste the function from SeqTools and figure out where it falls on its ass.

Description

Yeah, I do not remember what I changed in this function.

Usage

```
my_identifyAUBlocks(x, min.length = 20, p.to.start = 0.8,
    p.to.end = 0.55)
```

Arguments

x Sequence object

 $\label{eq:min.length} \mbox{ In dunno.}$

p.to.start P to start of course

p. to. end The p to end – wtf who makes names like this?

Value

a list of IRanges which contain a bunch of As and Us.

normalize_counts 167

normalize_counts	Perform a simple normalization of a count table.	
------------------	--	--

Description

This provides shortcut interfaces for normalization functions from deseq2/edger and friends.

Usage

```
normalize_counts(data, design = NULL, norm = "raw", ...)
```

Arguments

data Matrix of count data.

design Dataframe describing the experimental design. (conditions/batches/etc)

norm Normalization to perform: 'sflquantlqsmoothltmmlupperquartileltmmlrle' I keep wishy-washing on whether design is a required argument.

... More arguments might be necessary.

Value

Dataframe of normalized(counts)

See Also

edgeR limma DESeq2

Examples

```
## Not run:
   norm_table = normalize_counts(count_table, design=design, norm='qsmooth')
## End(Not run)
```

normalize_expt Normalize the data of an expt object. Save the original data, and note what was done.

Description

It is the responsibility of normalize_expt() to perform any arbitrary normalizations desired as well as to ensure that the data integrity is maintained. In order to do this, it writes the actions performed in expt\$state and saves the intermediate steps of the normalization in expt\$intermediate_counts. Furthermore, it should tell you every step of the normalization process, from count filtering, to normalization, conversion, transformation, and batch correction.

normalize_expt

Usage

```
normalize_expt(expt, transform = "raw", norm = "raw",
  convert = "raw", batch = "raw", filter = FALSE,
  annotations = NULL, fasta = NULL, entry_type = "gene",
  use_original = FALSE, batch1 = "batch", batch2 = NULL,
  batch_step = 5, low_to_zero = FALSE, thresh = 2, min_samples = 2,
  p = 0.01, A = 1, k = 1, cv_min = 0.01, cv_max = 1000, ...)
```

Arguments

expt Original expt.
transform Transformation desir

transform Transformation desired, usually log2.

norm How to normalize the data? (raw, quant, sf, upperquartile, tmm, rle)

convert Conversion to perform? (raw, cpm, rpkm, cp_seq_m)
batch Batch effect removal tool to use? (limma sva fsva ruv etc)
filter Filter out low/undesired features? (cbcb, pofa, kofa, others?)
annotations Used for rpkm – probably not needed as this is in fData now.

fasta Fasta file for cp_seq_m counting of oligos.

entry_type For getting genelengths by feature type (rpkm or cp_seq_m).

use_original Use the backup data in the expt class?
batch1 Experimental factor to extract first.

batch2 Second factor to remove (only with limma's removebatcheffect()).

batch_step From step 1-5, when should batch correction be applied?

low_to_zero When log transforming, change low numbers (< 0) to 0 to avoid NaN?

thresh Used by cbcb_lowfilter().

min_samples Also used by cbcb_lowfilter().

p Used by genefilter's pofa().

A Also used by genefilter's pofa().

k Used by genefilter's kofa().

cv_min Used by genefilter's cv().

cv_max Also used by genefilter's cv().

... more options

Value

Expt object with normalized data and the original data saved as 'original_expressionset'

See Also

genefilter limma sva edgeR DESeq2

orgdb_from_ah

Examples

orgdb_from_ah

Get an orgdb from an AnnotationHub taxonID.

Description

Ideally, annotationhub will one day provide a one-stop shopping source for a tremendous wealth of curated annotation databases, sort of like a non-obnoxious biomart. But for the moment, this function is more fragile than I would like.

Usage

```
orgdb_from_ah(ahid = NULL, title = NULL, species = NULL,
  type = "OrgDb")
```

Arguments

ahid TaxonID from AnnotationHub title Title for the annotation hub instance

species Species to download type Datatype to download

Value

An Orgdb instance

Author(s)

atb

See Also

AnnotationHub S4Vectors

```
## Not run:
  orgdbi <- mytaxIdToOrgDb(taxid)
## End(Not run)</pre>
```

pattern_count_genome

pattern_count_genome Find how many times a given pattern occurs in every gene of a genome.

Description

There are times when knowing how many times a given string appears in a genome/CDS is helpful. This function provides that information and is primarily used by cp_seq_m().

Usage

```
pattern_count_genome(fasta, gff = NULL, pattern = "TA",
   type = "gene", key = NULL)
```

Arguments

fasta	Genome sequence.
gff	Gff of annotation information from which to acquire CDS (if not provided it will just query the entire genome).
pattern	What to search for? This was used for thseq and TA is the mariner insertion point.
type	Column to use in the gff file.
key	What type of entry of the gff file to key from?

Details

This is once again a place where mcols() usage might improve the overall quality of life.

Value

Data frame of gene names and number of times the pattern appears/gene.

Author(s)

atb

See Also

Biostrings Rsamtools Rsamtools FaFile getSeq PDict vcountPDict

```
## Not run:
   num_pattern <- pattern_count_genome('mgas_5005.fasta', 'mgas_5005.gff')
## End(Not run)</pre>
```

pca_highscores 171

nca higheearas	Cat the highest flavort seewing games for every principle component
pca_highscores	Get the highest/lowest scoring genes for every principle component.

Description

This function uses princomp to acquire a principle component biplot for some data and extracts a dataframe of the top n genes for each component by score.

Usage

```
pca_highscores(expt, n = 20, cor = TRUE, vs = "means",
   logged = TRUE, row_label = NA)
```

Arguments

expt	Experiment to poke.
n	Number of genes to extract.
cor	Perform correlations?
vs	Do a mean or median when getting ready to perform the pca?
logged	Check for the log state of the data and adjust as deemed necessary?

Value

a list including the princomp biplot, histogram, and tables of top/bottom n scored genes with their scores by component.

See Also

```
stats princomp
```

```
## Not run:
  information <- pca_highscores(df=df, conditions=cond, batches=bat)
  information$pca_bitplot ## oo pretty
## End(Not run)</pre>
```

172 pca_information

pca_information

Gather information about principle components.

Description

Calculate some information useful for generating PCA plots. pca_information seeks to gather together interesting information to make principle component analyses easier, including: the results from (fast.)svd, a table of the r^2 values, a table of the variances in the data, coordinates used to make a pca plot for an arbitrarily large set of PCs, correlations and fstats between experimental factors and the PCs, and heatmaps describing these relationships. Finally, it will provide a plot showing how much of the variance is provided by the top-n genes and (optionally) the set of all PCA plots with respect to one another. (PCx vs. PCy)

Usage

```
pca_information(expt, expt_design = NULL, expt_factors = c("condition",
   "batch"), num_components = NULL, plot_pcas = FALSE, ...)
```

Arguments

expt	Data to analyze (usually exprs(somedataset)).
expt_design	Dataframe describing the experimental design, containing columns with useful information like the conditions, batches, number of cells, whatever
expt_factors	Character list of experimental conditions to query for $R^{\mbox{\scriptsize n}}2$ against the fast.svd of the data.
num_components	Number of principle components to compare the design factors against. If left null, it will query the same number of components as factors asked for.
plot_pcas	Plot the set of PCA plots for every pair of PCs queried.
	Extra arguments for the pca plotter

Value

a list of fun pca information: svd_u/d/v: The u/d/v parameters from fast.svd rsquared_table: A table of the rsquared values between each factor and principle component pca_variance: A table of the pca variances pca_data: Coordinates for a pca plot pca_cor: A table of the correlations between the factors and principle components anova_fstats: the sum of the residuals with the factor vs without (manually calculated) anova_f: The result from performing anova(withfactor, withoutfactor), the F slot anova_p: The p-value calculated from the anova() call anova_sums: The RSS value from the above anova() call cor_heatmap: A heatmap from recordPlot() describing pca_cor.

Warning

This function has gotten too damn big and needs to be split up.

See Also

```
corpcor stats fast.svd, 1m
```

pct_all_kegg

Examples

```
## Not run:
pca_info = pca_information(exprs(some_expt$expressionset), some_design, "all")
pca_info
## End(Not run)
```

pct_all_kegg

Extract the percent differentially expressed genes for all KEGG pathways.

Description

KEGGgraph provides some interesting functionality for mapping KEGGids and examining the pieces. This attempts to use that in order to evaluate how many 'significant' genes are in a given pathway.

Usage

```
pct_all_kegg(all_ids, sig_ids, organism = "dme", pathways = "all",
   pathdir = "kegg_pathways", verbose = FALSE, ...)
```

Arguments

all_ids	Set of all gene IDs in a given analysis.
sig_ids	Set of significant gene IDs.
organism	KEGG organism identifier.
pathways	What pathways to look at?
pathdir	Directory into which to copy downloaded pathway files.
verbose	Talky talky?
• • •	Options I might pass from other functions are dropped into arglist.

Value

Dataframe including the filenames, percentages, nodes included, and differential nodes.

See Also

KEGGgraph KEGGREST

174 please_install

pct_kegg_diff	Extract the percent differentially expressed genes in a given KEGG pathway.
---------------	---

Description

KEGGgraph provides some interesting functionality for mapping KEGGids and examining the pieces. This attempts to use that in order to evaluate how many 'significant' genes are in a given pathway.

Usage

```
pct_kegg_diff(all_ids, sig_ids, pathway = "00500", organism = "dme",
  pathdir = "kegg_pathways", ...)
```

Arguments

all_ids	Set of all gene IDs in a given analysis.
sig_ids	Set of significant gene IDs.
pathway	Numeric pathway identifier.
organism	KEGG organism identifier.
pathdir	Directory into which to copy downloaded pathway files.
	Options I might pass from other functions are dropped into arglist.

Value

Percent genes/pathway deemed significant.

See Also

KEGGgraph KEGGREST

please_install Automatic loading and/or installing of packages.	please_install	Automatic loading and/or installing of packages.	
---	----------------	--	--

Description

Load a library, install it first if necessary.

Usage

```
please_install(lib, update = FALSE)
```

plot_batchsv 175

Arguments

lib String name of a library to check/install.

update Update packages?

Details

This was taken from: http://sbamin.com/2012/11/05/tips-for-working-in-r-automatically-install-missing-package/ and initially provided by Ramzi Temanni.

Value

0 or 1, whether a package was installed or not.

See Also

```
BiocInstaller biocLite install.packages
```

Examples

```
## Not run:
  require.auto("ggplot2")
## End(Not run)
```

plot_batchsv

Make a dotplot of known batches vs. SVs.

Description

This should make a quick df of the factors and surrogates and plot them. Maybe it should be folded into plot_svfactor? Hmm, I think first I will write this and see if it is better.

Usage

```
plot_batchsv(expt, svs, sv = 1, batch_column = "batch",
  factor_type = "factor")
```

Arguments

expt Experiment from which to acquire the design, counts, etc.

svs Set of surrogate variable estimations from sva/svg or batch estimates.

batch_column Which experimental design column to use?

factor_type This may be a factor or range, it is intended to plot a scatterplot if it is a range,

a dotplot if a factor.

plot_bcv

Value

Plot of batch vs surrogate variables as per Leek's work.

See Also

```
sva ggplot2
```

Examples

```
## Not run:
    estimate_vs_snps <- plot_batchsv(start, surrogate_estimate, "snpcategory")
## End(Not run)</pre>
```

plot_bcv

Steal edgeR's plotBCV() and make it a ggplot2.

Description

This was written primarily to understand what that function is doing in edgeR.

Usage

```
plot_bcv(data)
```

Arguments

data

A dataframe/expt/exprs with count data

Value

```
a plot! of the BCV a la ggplot2.
```

See Also

```
edgeR plotBCV
```

```
## Not run:
bcv <- plot_bcv(expt)
summary(bcv$data)
bcv$plot
## End(Not run)</pre>
```

plot_boxplot 177

plot_boxplot	Make a ggplot boxplot of a set of samples.

Description

Boxplots and density plots provide complementary views of data distributions. The general idea is that if the box for one sample is significantly shifted from the others, then it is likely an outlier in the same way a density plot shifted is an outlier.

Usage

```
plot_boxplot(data, colors = NULL, title = NULL, violin = FALSE,
    scale = NULL, expt_names = NULL, label_chars = 10, ...)
```

Arguments

data	Expt or data frame set of samples.
colors	Color scheme, if not provided will make its own.
title	A title!
violin	Print this as a violin rather than a just box/whiskers?
scale	Whether to log scale the y-axis.
expt_names	Another version of the sample names for printing.
label_chars	Maximum number of characters for abbreviating sample names
	More parameters are more fun!

Value

Ggplot2 boxplot of the samples. Each boxplot contains the following information: a centered line describing the median value of counts of all genes in the sample, a box around the line describing the inner-quartiles around the median (quartiles 2 and 3 for those who are counting), a vertical line above/below the box which shows 1.5x the inner quartile range (a common metric of the non-outliers), and single dots for each gene which is outside that range. A single dot is transparent.

See Also

```
ggplot2 reshape2 geom_boxplot melt scale_x_discrete
```

```
## Not run:
   a_boxplot <- plot_boxplot(expt)
   a_boxplot ## ooo pretty boxplot look at the lines
## End(Not run)</pre>
```

plot_corheat

plot_cleaved	Plot the average mass and expected intensity of a set of sequences given an enzyme.

Description

This uses the cleaver package to generate a plot of expected intensities vs. weight for a list of protein sequences.

Usage

```
plot_cleaved(pep_sequences, enzyme = "trypsin", start = 600,
  end = 1500)
```

Arguments

pep_sequences Set of protein sequences.

enzyme One of the allowed enzymes for cleaver.

start Limit the set of fragments from this point

end to this point.

Value

List containing the distribution of weights and the associated plot.

plot_corheat	Make a heatmap.3 description of the correlation between samples.

Description

Given a set of count tables and design, this will calculate the pairwise correlations and plot them as a heatmap. It attempts to standardize the inputs and eventual output.

Usage

```
plot_corheat(expt_data, expt_colors = NULL, expt_design = NULL,
  method = "pearson", expt_names = NULL, batch_row = "batch",
  title = NULL, label_chars = 10, ...)
```

plot_density 179

Arguments

expt_data	Dataframe, expt, or expressionset to work with.
expt_colors	Color scheme for the samples, not needed if this is an expt.
expt_design	Design matrix describing the experiment, not needed if this is an expt.
method	Correlation statistic to use. (pearson, spearman, kendall, robust).
expt_names	Alternate names to use for the samples.
batch_row	Name of the design row used for 'batch' column colors.
title	Title for the plot.
label_chars	Limit on the number of label characters.
	More options are wonderful!

Value

Gplots heatmap describing describing how the samples are clustering vis a vis pairwise correlation.

See Also

```
grDevice hpgl_cor brewer.pal recordPlot
```

Examples

```
## Not run:
   corheat_plot <- hpgl_corheat(expt=expt, method="robust")
## End(Not run)</pre>
```

plot_density

Create a density plot, showing the distribution of each column of data.

Description

Density plots and boxplots are cousins and provide very similar views of data distributions. Some people like one, some the other. I think they are both colorful and fun!

Usage

```
plot_density(data, colors = NULL, expt_names = NULL,
  position = "identity", direct = TRUE, fill = NULL, title = NULL,
  scale = NULL, colors_by = "condition", label_chars = 10, ...)
```

180 plot_de_pvals

Arguments

data Expt, expressionset, or data frame.

colors Color scheme to use.
expt_names Names of the samples.

position How to place the lines, either let them overlap (identity), or stack them.

direct Use direct.labels for labeling the plot?

fill Fill the distributions? This might make the plot unreasonably colorful.

title Title for the plot.
scale Plot on the log scale?
colors_by Factor for coloring the lines

label_chars Maximum number of characters in sample names before abbreviation.

.. sometimes extra arguments might come from graph_metrics()

Value

```
ggplot2 density plot!
```

See Also

```
ggplot2 geom_density
```

Examples

```
## Not run:
  funkytown <- plot_density(data)
## End(Not run)</pre>
```

plot_de_pvals

Given a DE table with p-values, plot them.

Description

Plot a multi-histogram containing (adjusted)p-values.

Usage

```
plot_de_pvals(combined, type = "limma", p_type = "both",
    columns = NULL, ...)
```

Arguments

combined Table to extract the values from.

type If provided, extract the type_p and type_adjp columns.

Otherwise, extract whatever columns are provided.

Arguments passed through to the histogram plotter

plot_disheat 181

Value

Multihistogram of the result.

plot_disheat	Make a heatmap.3 of the distances (euclidean by default) between samples.
--------------	---

Description

Given a set of count tables and design, this will calculate the pairwise distances and plot them as a heatmap. It attempts to standardize the inputs and eventual output.

Usage

```
plot_disheat(expt_data, expt_colors = NULL, expt_design = NULL,
  method = "euclidean", expt_names = NULL, batch_row = "batch",
  title = NULL, label_chars = 10, ...)
```

Arguments

expt_data	Dataframe, expt, or expressionset to work with.
expt_colors	Color scheme (not needed if an expt is provided).
expt_design	Design matrix (not needed if an expt is provided).
method	Distance metric to use.
expt_names	Alternate names to use for the samples.
batch_row	Name of the design row used for 'batch' column colors.
title	Title for the plot.
label_chars	Limit on the number of label characters.
• • •	More parameters!

Value

a recordPlot() heatmap describing the distance between samples.

See Also

```
RColorBrewer brewer.pal heatmap.2 recordPlot
```

```
## Not run:
    disheat_plot = plot_disheat(expt=expt, method="euclidean")
## End(Not run)
```

182 plot_dist_scatter

•	Make a scatter plot between two sets of numbers with a cheesy distance netric and some statistics of the two sets.
---	--

Description

The distance metric should be codified and made more intelligent. Currently it creates a dataframe of distances which are absolute distances from each axis, multiplied by each other, summed by axis, then normalized against the maximum.

Usage

```
plot_dist_scatter(df, tooltip_data = NULL, gvis_filename = NULL,
    size = 2)
```

Arguments

df Dataframe likely containing two columns.
tooltip_data Df of tooltip information for gvis graphs.
gvis_filename Filename to write a fancy html graph.
size Size of the dots.

Value

Ggplot2 scatter plot. This plot provides a "bird's eye" view of two data sets. This plot assumes the two data structures are not correlated, and so it calculates the median/mad of each axis and uses these to calculate a stupid, home-grown distance metric away from both medians. This distance metric is used to color dots which are presumed the therefore be interesting because they are far from 'normal.' This will make a fun clicky googleVis graph if requested.

See Also

```
ggplot2 plot_gvis_scatter geom_point plot_linear_scatter
```

plot_epitrochoid 183

Make epitrochoid plots!

Description

7, 2, 6, 7 should give a pretty result.

Usage

```
plot_epitrochoid(radius_a = 7, radius_b = 2, dist_b = 6,
  revolutions = 7, increments = 6480)
```

Arguments

radius_a Radius of the major circle radius_b And the smaller circle.

dist_b between b and the drawing point.

revolutions How many times to revolve through the spirograph.

increments How many dots to lay down while writing.

plot_essentiality

Plot the essentiality of a library as per DeJesus et al.

Description

This provides a plot of the essentiality metrics 'zbar' with respect to gene.

Usage

```
plot_essentiality(file)
```

Arguments

file

a file created using the perl script 'essentiality_tas.pl'

Value

A couple of plots

See Also

ggplot2

184 plot_goseq_pval

plot_fun_venn	A quick wrapper around venneuler to help label stuff
proc_ran_verm	11 quick wrapper around venticuler to help tabel stuff

Description

venneuler makes pretty venn diagrams, but no labels!

Usage

```
plot_fun_venn(ones = c(), twos = c(), threes = c(), fours = c(), fives = c(), factor = 0.9)
```

Arguments

ones	Character list of singletone categories
twos	Character list of doubletone categories
threes	Character list of tripletone categories
fours	Character list of quad categories
fives	Character list of quint categories
factor	Currently unused, but intended to change the radial distance to the label from the center of each circle.

Value

Two element list containing the venneuler data and the plot.

See Also

venneuler

plot_goseq_pval Make a pvalue plot from goseq data.

Description

With minor changes, it is possible to push the goseq results into a clusterProfiler-ish pvalue plot. This handles those changes and returns the ggplot results.

```
plot_goseq_pval(goterms, wrapped_width = 30, cutoff = 0.1, n = 30,
    mincat = 5, level = NULL, ...)
```

plot_gostats_pval 185

Arguments

goterms Some data from goseq!

wrapped_width Number of characters before wrapping to help legibility.

cutoff Pvalue cutoff for the plot.

n How many groups to include?

mincat Minimum size of the category for inclusion.

level Levels of the ontology tree to use.

... Arguments passed from simple_goseq()

Value

Plots!

See Also

goseq clusterProfiler goseq plot_ontpval

plot_gostats_pval Make a pvalue plot similar to that from clusterprofiler from gostats data.

Description

clusterprofiler provides beautiful plots describing significantly overrepresented categories. This function attempts to expand the repetoire of data available to them to include data from gostats. The pval_plot function upon which this is based now has a bunch of new helpers now that I understand how the ontology trees work better, this should take advantage of that, but currently does not.

Usage

```
plot_gostats_pval(gs_result, wrapped_width = 20, cutoff = 0.1,
    n = 30, group_minsize = 5)
```

Arguments

gs_result Ontology search results.

wrapped_width Make the text large enough to read.

cutoff What is the maximum pvalue allowed?

n How many groups to include in the plot?

group_minsize Minimum group size before inclusion.

Value

Plots!

186 plot_gprofiler_pval

See Also

clusterProfiler plot_ontpval

plot_gprofiler_pval Make a pvalue plot from gprofiler data.

Description

The p-value plots from clusterProfiler are pretty, this sets the gprofiler data into a format suitable for plotting in that fashion and returns the resulting plots of significant ontologies.

Usage

```
plot_gprofiler_pval(gp_result, wrapped_width = 30, cutoff = 0.1,
    n = 30, group_minsize = 5, scorer = "recall", ...)
```

Arguments

gp_result Some data from gProfiler.

wrapped_width Maximum width of the text names.

cutoff P-value cutoff for the plots.

n Maximum number of ontologies to include.

group_minsize Minimum ontology group size to include.

scorer Which column to use for scoring the data.

... Options I might pass from other functions are dropped into arglist.

Value

List of MF/BP/CC pvalue plots.

See Also

topgo clusterProfiler

plot_gvis_ma 187

plot_gvis_ma	Make an html version of an MA plot: M(log ratio of conditions) / A(mean average).

Description

A fun snippet from wikipedia: "In many microarray gene expression experiments, an underlying assumption is that most of the genes would not see any change in their expression therefore the majority of the points on the y-axis (M) would be located at 0, since Log(1) is 0. If this is not the case, then a normalization method such as LOESS should be applied to the data before statistical analysis. If the median line is not straight, the data should be normalized.

Usage

```
plot_gvis_ma(df, tooltip_data = NULL, p = 0.05, logfc = 1,
  p_col = "AdjPVal", fc_col = "logfc", avg_col = "AvgExp",
  filename = "html/gvis_ma_plot.html", base_url = "", ...)
```

Arguments

df	Data frame of counts which have been normalized counts by sample-type, which is to say the output from voom/voomMod/hpgl_voom().
tooltip_data	Df of tooltip information (gene names, etc).
р	P-value cutoff
logfc	Logfc cutoff
p_col	Column in the data containing the p-values.
fc_col	Column in the data containing the fold-changes.
avg_col	Column in the data containing the average expression values.
filename	Filename to write a fancy html graph.
base_url	String with a basename used for generating URLs for clicking dots on the graph.
	more options are more options!

Value

NULL, but along the way an html file is generated which contains a googleVis MA plot. See plot_de_ma() for details.

See Also

```
googleVis plot_ma_de
```

plot_gvis_scatter

Examples

plot_gvis_scatter

Make an html version of a scatter plot.

Description

Given an arbitrary scatter plot, we can make it pretty and javascript-tacular using this function.

Usage

```
plot_gvis_scatter(df, tooltip_data = NULL,
  filename = "html/gvis_scatter.html", base_url = "",
  trendline = NULL)
```

Arguments

df Df of two columns to compare.

tooltip_data Df of tooltip information for gvis graphs. filename Filename to write a fancy html graph.

trendline Add a trendline?

Value

NULL, but along the way an html file is generated which contains a googleVis scatter plot. See plot_scatter() for details.

See Also

```
googleVis gvisScatterChart
```

plot_gvis_volcano 189

	14 1 1 1 1	C 1 1.
plot_gvis_volcano	Make an html version	oj an voicano piot.

Description

Volcano plots provide some visual clues regarding the success of a given contrast. For our data, it has the -log10(pvalue) on the y-axis and fold-change on the x. Here is a neat snippet from wikipedia describing them generally: "The concept of volcano plot can be generalized to other applications, where the x-axis is related to a measure of the strength of a statistical signal, and y-axis is related to a measure of the statistical significance of the signal."

Usage

```
plot_gvis_volcano(toptable_data, logfc = 1, p = 0.05,
  tooltip_data = NULL, filename = "html/gvis_vol_plot.html",
  base_url = "", ...)
```

Arguments

p Maximum p value to allow.tooltip_data Df of tooltip information.

filename Filename to write a fancy html graph.

base_url String with a basename used for generating URLs for clicking dots on the graph.

... more options

Value

NULL, but along the way an html file is generated which contains a googleVis volcano plot.

See Also

googleVis

190 plot_heatmap

plot_heatmap	.3 plot, does the	work for plot_disheat and
--------------	-------------------	---------------------------

Description

This does what is says on the tin. Sets the colors for correlation or distance heatmaps, handles the calculation of the relevant metrics, and plots the heatmap.

Usage

```
plot_heatmap(expt_data, expt_colors = NULL, expt_design = NULL,
  method = "pearson", expt_names = NULL, type = "correlation",
  batch_row = "batch", title = NULL, label_chars = 10, ...)
```

Arguments

expt_data	Dataframe, expt, or expressionset to work with.
expt_colors	Color scheme for the samples.
expt_design	Design matrix describing the experiment vis a vis conditions and batches.
method	Distance or correlation metric to use.
expt_names	Alternate names to use for the samples.
type	Defines the use of correlation, distance, or sample heatmap.
batch_row	Name of the design row used for 'batch' column colors.
title	Title for the plot.
label_chars	Limit on the number of label characters.
	I like elipses!

Value

a recordPlot() heatmap describing the distance between samples.

See Also

RColorBrewer brewer.pal recordPlot

plot_heatplus 191

plot_heatplus	Potential replacement for heatmap.2 based plots.

Description

Heatplus is an interesting tool, I have a few examples of using it and intend to include them here.

Usage

```
plot_heatplus(expt, type = "correlation", method = "pearson",
   annot_columns = "batch", annot_rows = "condition", cutoff = 1,
   cluster_colors = NULL, scale = "none", cluster_width = 2,
   cluster_function = NULL, heatmap_colors = NULL)
```

Arguments

expt	Experiment to try plotting.
type	What comparison method to use on the data (distance or correlation)?
method	What distance/correlation method to perform?
annot_columns	Set of columns to include as terminal columns next to the heatmap.
annot_rows	Set of columns to include as terminal rows below the heatmap.
cutoff	Cutoff used to define color changes in the annotated clustering.
cluster_colors	Choose colors for the clustering?
scale	Scale the heatmap colors?
cluster_width	How much space to include between clustering?
cluster_function	
	Choose an alternate clustering function than hclust()?
heatmap_colors	Choose your own heatmap cluster palette?

Value

List containing the returned heatmap along with some parameters used to create it.

192 plot_histogram

plot_histogram M	ake a pretty histogram of something.
------------------	--------------------------------------

Description

A shortcut to make a ggplot2 histogram which makes an attempt to set reasonable bin widths and set the scale to log if that seems a good idea.

Usage

```
plot_histogram(df, binwidth = NULL, log = FALSE, bins = 500,
  fillcolor = "darkgrey", color = "black")
```

Arguments

df Dataframe of lots of pretty numbers. binwidth Width of the bins for the histogram.

log Replot on the log scale?

bins Number of bins for the histogram.

fillcolor Change the fill colors of the plotted elements?

color Change the color of the lines of the plotted elements?

Value

Ggplot histogram.

See Also

```
ggplot2 geom_histogram geom_density
```

```
## Not run:
  kittytime = plot_histogram(df)
## End(Not run)
```

plot_hypotrochoid 193

plot_hypotrochoid Make hypotrochoid p	oid plots!
---------------------------------------	------------

Description

3,7,1 should give the classic 7 leaf clover

Usage

```
plot_hypotrochoid(radius_a = 3, radius_b = 7, dist_b = 1,
  revolutions = 7, increments = 6480)
```

Arguments

radius_a Radius of the major circle radius_b And the smaller circle.

dist_b between b and the drawing point.

revolutions How many times to revolve through the spirograph.

increments How many dots to lay down while writing.

proc_intensity_m

Description

I want to have a pretty plot of peak intensities and m/z. The plot provided by this function is interesting, but suffers from some oddities; notably that it does not currently separate the MS1 and MS2 data. Since I am stuck on this forsaken plane with no hope of ever leaving, perhaps I can add that now.

Usage

```
plot_intensity_mz(mzxml_data, loess = FALSE, alpha = 0.5, ms1 = TRUE,
    ms2 = TRUE, x_scale = NULL, y_scale = NULL, ...)
```

Arguments

mzxml_data	The data structure from extract_mzxml or whatever it is.
loess	Do a loess smoothing from which to extract a function describing the data? This is terribly slow, and in the data I have examined so far, not very helpful, so it is FALSE by default.

alpha Make the plotted dots opaque to this degree.

ms1 Include MS1 data in the plot?

194 plot_libsize

ms2	Include MS2 data in the plot?
x_scale	Plot the x-axis on a non linear scale?
y_scale	Plot the y-axis on a non linear scale?
	Extra arguments for the downstream functions.

Value

ggplot2 goodness.

plot_legend

Scab the legend from a PCA plot and print it alone

Description

This way I can have a legend object to move about.

Usage

```
plot_legend(stuff)
```

Arguments

stuff

This can take either a ggplot2 pca plot or some data from which to make one.

Value

A legend!

plot_libsize

Make a ggplot graph of library sizes.

Description

It is often useful to have a quick view of which samples have more/fewer reads. This does that and maintains one's favorite color scheme and tries to make it pretty!

```
plot_libsize(data, condition = NULL, colors = NULL, text = TRUE,
  order = NULL, title = NULL, yscale = NULL, expt_names = NULL,
  label_chars = 10, ...)
```

plot_libsize_prepost 195

Arguments

data Expt, dataframe, or expressionset of samples.

condition vector of sample condition names.

colors Color scheme if the data is not an expt.

text Add the numeric values inside the top of the bars of the plot?

order Explicitly set the order of samples in the plot?

title Title for the plot.

yscale Whether or not to log10 the y-axis.

expt_names Design column or manually selected names for printing sample names.

label_chars Maximum number of characters before abbreviating sample names.

... More parameters for your good time!

Value

a ggplot2 bar plot of every sample's size

See Also

```
ggplot2 geom_bar geom_text prettyNum scale_y_log10
```

Examples

```
## Not run:
  libsize_plot <- plot_libsize(expt=expt)
  libsize_plot ## ooo pretty bargraph
## End(Not run)</pre>
```

plot_libsize_prepost

Thanks to Sandra Correia for this! This function attempts to represent the change in the number of genes which are well/poorly represented in the data before and after performing a low-count filter.

Description

Thanks to Sandra Correia for this! This function attempts to represent the change in the number of genes which are well/poorly represented in the data before and after performing a low-count filter.

```
plot_libsize_prepost(expt, low_limit = 2, filter = TRUE, ...)
```

196 plot_linear_scatter

Arguments

expt Input expressionset.

low_limit A threshold to define 'low-representation.'
filter Method used to low-count filter the data.

... Extra arbitrary arguments to pass to normalize_expt()

Value

Bar plot showing the number of genes below the low_limit before and after filtering the data.

Description

Make a scatter plot between two groups with a linear model superimposed and some supporting statistics.

Usage

```
plot_linear_scatter(df, tooltip_data = NULL, gvis_filename = NULL,
  cormethod = "pearson", size = 2, loess = FALSE, identity = FALSE,
  gvis_trendline = NULL, z_lines = FALSE, first = NULL,
  second = NULL, base_url = NULL, pretty_colors = TRUE,
  color_high = NULL, color_low = NULL, alpha = 0.4, ...)
```

Arguments

df Dataframe likely containing two columns.
tooltip_data Df of tooltip information for gvis graphs.
gvis_filename Filename to write a fancy html graph.
cormethod What type of correlation to check?

size Size of the dots on the plot.
loess Add a loess estimation?
identity Add the identity line?

gvis_trendline Add a trendline to the gvis plot? There are a couple possible types, I think linear

is the most common.

z_lines Include lines defining the z-score boundaries.

first First column to plot.
second Second column to plot.
base_url Base url to add to the plot.

plot_ma_de 197

```
pretty_colors Colors!

color_high Chosen color for points significantly above the mean.

color_low Chosen color for points significantly below the mean.

alpha Choose an alpha channel to define how see-through the dots are.

Extra args likely used for choosing significant genes.
```

Value

List including a ggplot2 scatter plot and some histograms. This plot provides a "bird's eye" view of two data sets. This plot assumes a (potential) linear correlation between the data, so it calculates the correlation between them. It then calculates and plots a robust linear model of the data using an 'SMDM' estimator (which I don't remember how to describe, just that the document I was reading said it is good). The median/mad of each axis is calculated and plotted as well. The distance from the linear model is finally used to color the dots on the plot. Histograms of each axis are plotted separately and then together under a single cdf to allow tests of distribution similarity. This will make a fun clicky googleVis graph if requested.

See Also

```
robust stats ggplot2 lmRob weights plot_histogram
```

Examples

plot_ma_de

Make a pretty MA plot from one of limma, deseq, edger, or basic.

Description

Because I can never remember, the following from wikipedia: "An MA plot is an application of a Bland-Altman plot for visual representation of two channel DNA microarray gene expression data which has been transformed onto the M (log ratios) and A (mean average) scale."

```
plot_ma_de(table, expr_col = "logCPM", fc_col = "logFC",
    p_col = "qvalue", p = 0.05, alpha = 0.4, logfc = 1,
    label_numbers = TRUE, size = 2, tooltip_data = NULL,
    gvis_filename = NULL, invert = FALSE, ...)
```

198 plot_ma_de

Arguments

table	Df of linear-modelling, normalized counts by sample-type,
expr_col	Column showing the average expression across genes.
fc_col	Column showing the logFC for each gene.
p_col	Column containing the relevant p values.
p	Name of the pvalue column to use for cutoffs.
alpha	How transparent to make the dots.
logfc	Fold change cutoff.
label_numbers	Show how many genes were 'significant', 'up', and 'down'?
size	How big are the dots?
tooltip_data	Df of tooltip information for gvis.
gvis_filename	Filename to write a fancy html graph.
invert	Invert the ma plot?

More options for you

Value

ggplot2 MA scatter plot. This is defined as the rowmeans of the normalized counts by type across all sample types on the x axis, and the log fold change between conditions on the y-axis. Dots are colored depending on if they are 'significant.' This will make a fun clicky googleVis graph if requested.

See Also

 $\label{limmagoogleVisDESeq2edgeR} I immagoogleVisDESeq2edgeR \ plot_gvis_matoptable \ voom \ hpgl_voom \ lmFit \ make Contrasts \ contrasts. fit$

```
## Not run:
   plot_ma(voomed_data, table, gvis_filename="html/fun_ma_plot.html")
   ## Currently this assumes that a variant of toptable was used which
   ## gives adjusted p-values. This is not always the case and I should
   ## check for that, but I have not yet.

## End(Not run)
```

plot_multihistogram 199

plot_multihistogram

Make a pretty histogram of multiple datasets.

Description

If there are multiple data sets, it might be useful to plot them on a histogram together and look at the t.test results between distributions.

Usage

```
plot_multihistogram(data, log = FALSE, binwidth = NULL, bins = NULL,
  colors = NULL)
```

Arguments

data Dataframe of lots of pretty numbers, this also accepts lists.

log Plot the data on the log scale?

binwidth Set a static bin width with an unknown # of bins? If neither of these are provided,

then bins is set to 500, if both are provided, then bins wins.

bins Set a static # of bins of an unknown width?

Value

List of the ggplot histogram and some statistics describing the distributions.

See Also

```
ggplot2 pairwise.t.test ddply
```

```
## Not run:
  kittytime = plot_multihistogram(df)
## End(Not run)
```

plot_mzxml_boxplot

nlat	miil +	iplot
DIOL	IIIU I L	TOTOL

Make a grid of plots.

Description

Make a grid of plots.

Usage

```
plot_multiplot(plots, file, cols = NULL, layout = NULL)
```

Arguments

plots a list of plots file a file to write to

cols the number of columns in the grid

layout set the layout specifically

Value

a multiplot!

 ${\tt plot_mzxml_boxplot}$

Make a boxplot out of some of the various data available in the mzxml

Description

There are a few data within the mzXML raw data files which are likely candidates for simple summary via a boxplot/densityplot/whatever. For the moment I am just doing boxplots of a few of them. Since my metadata extractor dumps a couple of tables, one must choose a desired table and column from it to plot.

```
plot_mzxml_boxplot(mzxml_data, table = "precursors",
  column = "precursorintensity", violin = FALSE, names = NULL,
  title = NULL, scale = NULL, ...)
```

plot_nonzero 201

Arguments

mzxml_data	Provide a list of mzxml data, one element for each sample.
table	One of precursors or scans
column	One of the columns from the table; if 'scans' is chosen, then likely choices include: 'peakscount', 'basepeakmz', 'basepeakintensity'; if 'precursors' is chosen, then the only likely choice for the moment is 'precursorintensity'.
violin	Print the samples as violins rather than only box/whiskers?
names	Names for the x-axis of the plot.
title	Title the plot?
scale	Put the data on a specific scale?
	Further arguments, presumably for colors or some such.

Value

Boxplot describing the requested column of data in the set of mzXML files.

plot_nonzero	Make a ggplot graph of the number of non-zero genes by sample.

Description

This puts the number of genes with > 0 hits on the y-axis and CPM on the x-axis. Made by Ramzi Temanni <temanni at umd dot edu>.

Usage

```
plot_nonzero(data, design = NULL, colors = NULL, plot_labels = NULL,
  expt_names = NULL, label_chars = 10, plot_legend = FALSE,
  title = NULL, ...)
```

Arguments

data	Expt, expressionset, or dataframe.
design	Eesign matrix.
colors	Color scheme.
plot_labels	How do you want to label the graph? 'fancy' will use directlabels() to try to match the labels with the positions without overlapping anything else will just stick them on a 45' offset next to the graphed point.
expt_names	Column or character list of preferred sample names.
label_chars	How many characters for sample names before abbreviation.
plot_legend	Print a legend for this plot?
title	Add a title?
	rawr!

202 plot_num_siggenes

Value

a ggplot2 plot of the number of non-zero genes with respect to each library's CPM.

See Also

```
ggplot2 geom_point geom_dl
```

Examples

```
## Not run:
  nonzero_plot = plot_nonzero(expt=expt)
  nonzero_plot ## ooo pretty
## End(Not run)
```

plot_num_siggenes

Given a DE table with fold changes and p-values, show how 'significant' changes with changing cutoffs.

Description

Sometimes one might want to know how many genes are deemed significant while shifting the bars which define significant. This provides that metrics as a set of tables of numbers of significant up/down genes when p-value is held constant, as well as number when fold-change is held constant.

Usage

```
plot_num_siggenes(table, methods = c("limma", "edger", "deseq", "ebseq"),
bins = 100, constant_p = 0.05, constant_fc = 0)
```

Arguments

table DE table to examine.

methods List of methods to use when plotting.

bins Number of incremental changes in p-value/FC to examine.

constant_p When plotting changing FC, where should the p-value be held?

constant_fc When plotting changing p, where should the FC be held?

Value

Plots and dataframes describing the changing definition of 'significant.'

See Also

ggplot2

plot_ontpval 203

Examples

```
## Not run:
    crazy_sigplots <- plot_num_siggenes(pairwise_result)
## End(Not run)</pre>
```

plot_ontpval

Make a pvalue plot from a df of IDs, scores, and p-values.

Description

This function seeks to make generating pretty pvalue plots as shown by clusterprofiler easier.

Usage

```
plot_ontpval(df, ontology = "MF", fontsize = 14, numerator = NULL,
  denominator = NULL)
```

Arguments

df Some data from topgo/goseq/clusterprofiler.

ontology Ontology to plot (MF,BP,CC).

fontsize Fiddling with the font size may make some plots more readable.

numerator Column used for printing a ratio of genes/category.

Column used for printing a ratio of genes/category.

Value

Ggplot2 plot of pvalues vs. ontology.

See Also

```
goseq ggplot2 goseq
```

204 plot_pca

plot_pairwise_ma

Plot all pairwise MA plots in an experiment.

Description

Use affy's ma.plot() on every pair of columns in a data set to help diagnose problematic samples.

Usage

```
plot_pairwise_ma(data, log = NULL, ...)
```

Arguments

data Expt expressionset or data frame.

log Is the data in log format?

... Options are good and passed to arglist().

Value

List of affy::maplots

See Also

```
affy ma.plot
```

Examples

```
## Not run:
    ma_plots = plot_pairwise_ma(expt=some_expt)
## End(Not run)
```

plot_pca

Make a ggplot PCA plot describing the samples' clustering.

Description

Make a ggplot PCA plot describing the samples' clustering.

```
plot_pca(data, design = NULL, plot_colors = NULL, plot_title = NULL,
    plot_size = 5, plot_alpha = NULL, plot_labels = NULL,
    size_column = NULL, pc_method = "fast_svd", x_pc = 1, y_pc = 2,
    pc_type = "sample", num_pc = NULL, expt_names = NULL,
    label_chars = 10, ...)
```

plot_pca 205

Arguments

data an expt set of samples. design a design matrix and. plot_colors a color scheme. a title for the plot. plot_title plot_size size for the glyphs on the plot. Add an alpha channel to the dots? plot_alpha add labels? Also, what type? FALSE, "default", or "fancy". plot_labels use an experimental factor to size the glyphs of the plot size_column how to extract the components? (svd pc_method Component to put on the x axis. x_pc у_рс Component to put on the y axis. pc_type Reduce the data by samples or genes? How many components to calculate, default to the number of rows in the metanum_pc Column or character list of preferred sample names. expt_names label_chars Maximum number of characters before abbreviating sample names. Arguments passed through to the pca implementations and plotter.

Value

a list containing the following (this is currently wrong)

- 1. pca = the result of fast.svd()
- 2. plot = ggplot2 pca_plot describing the principle component analysis of the samples.
- 3. table = a table of the PCA plot data
- 4. res = a table of the PCA res data
- 5. variance = a table of the PCA plot variance

See Also

```
directlabels geom_dl plot_pcs
```

```
## Not run:
    pca_plot <- plot_pca(expt=expt)
    pca_plot
## End(Not run)</pre>
```

206 plot_pcload

plot_pcfactor	make a dotplot of some categorised factors and a set of principle components.
---------------	---

Description

This should make a quick df of the factors and PCs and plot them.

Usage

```
plot_pcfactor(pc_df, expt, exp_factor = "condition", component = "PC1")
```

Arguments

pc_df Df of principle components.

expt Expt containing counts, metadata, etc. exp_factor Experimental factor to compare against.

component Which principal component to compare against?

Value

Plot of principle component vs factors in the data

See Also

ggplot2

Examples

```
## Not run:
    estimate_vs_pcs <- plot_pcfactor(pcs, times)
## End(Not run)</pre>
```

plot_pcload

Print a plot of the top-n most PC loaded genes.

Description

Sometimes it is nice to know what is happening with the genes which have the greatest effect on a given principal component. This function provides that.

```
plot_pcload(expt, genes = 40, desired_pc = 1, which_scores = "high",
    ...)
```

plot_pcs 207

Arguments

expt Input expressionset.

genes How many genes to observe?

desired_pc Which component to examine?

which_scores Perhaps one wishes to see the least-important genes, if so set this to low.

... Extra arguments passed, currently to nothing.

Value

List containing an expressionset of the subset and a plot of their expression.

plot_pcs Plot principle components and make them pretty.

Description

All the various dimension reduction methods share some of their end-results in common. Most notably a table of putative components which may be plotted against one another so that one may stare at the screen and look for clustering among the samples/genes/whatever. This function attempts to make that process as simple and pretty as possible.

Usage

```
plot_pcs(pca_data, first = "PC1", second = "PC2", variances = NULL,
  design = NULL, plot_title = TRUE, plot_labels = NULL,
  x_label = NULL, y_label = NULL, plot_size = 5, plot_alpha = NULL,
  size_column = NULL, rug = TRUE, cis = c(0.95, 0.9), ...)
```

Arguments

pca data I	Dataframe of prin	ciple components	PC1 PC1	V with anv	other arbitrary infor-
------------	-------------------	------------------	---------	------------	------------------------

mation.

first Principle component PCx to put on the x axis. second Principle component PCy to put on the y axis.

variances List of the percent variance explained by each component.

design Experimental design with condition batch factors.

plot_title Title for the plot.

plot_labels Parameter for the labels on the plot.

x_label Label for the x-axis.y_label Label for the y-axis.

plot_size Size of the dots on the plot

plot_alpha Add an alpha channel to the dots?

208 plot_pct_kept

```
size_column Experimental factor to use for sizing the glyphs rug Include the rugs on the sides of the plot?

cis What (if any) confidence intervals to include.

Extra arguments dropped into arglist
```

Value

```
gplot2 PCA plot
```

See Also

```
ggplot2 geom_dl
```

Examples

```
## Not run:
    pca_plot = plot_pcs(pca_data, first="PC2", second="PC4", design=expt$design)
## End(Not run)
```

plot_pct_kept

Make a ggplot graph of the percentage/number of reads kept/removed.

Description

The function expt_exclude_genes() removes some portion of the original reads. This function will make it possible to see what is left.

Usage

```
plot_pct_kept(data, row = "pct_kept", condition = NULL,
  colors = NULL, names = NULL, text = TRUE, title = NULL,
  yscale = NULL, ...)
```

Arguments

data	Dataframe of the material remaining, usually expt\$summary_table
row	Row name to plot.
condition	vector of sample condition names.
colors	Color scheme if the data is not an expt.
names	Alternate names for the x-axis.
text	Add the numeric values inside the top of the bars of the plot?
title	Title for the plot.
yscale	Whether or not to log10 the y-axis.
	More parameters for your good time!

plot_peprophet_data 209

Value

```
a ggplot2 bar plot of every sample's size
```

See Also

```
ggplot2 geom_bar geom_text prettyNum scale_y_log10
```

Examples

```
## Not run:
   kept_plot <- plot_pct_kept(expt_removed)
   kept_plot ## ooo pretty bargraph
## End(Not run)</pre>
```

plot_peprophet_data

Plot some data from the result of extract_peprophet_data()

Description

extract_peprophet_data() provides a ridiculously large data table of a comet result after processing by RefreshParser and xinteract/peptideProphet. This table has some 37-ish columns and I am not entirely certain which ones are useful as diagnostics of the data. I chose a few and made options to pull some/most of the rest. Lets play!

Usage

```
plot_peprophet_data(table, xaxis = "precursor_neutral_mass",
    xscale = NULL, yaxis = "num_matched_ions", yscale = NULL,
    size_column = "prophet_probability", ...)
```

Arguments

table	Big honking data table from extract_peprophet_data()
xaxis	Column to plot on the x-axis
xscale	Change the scale of the x-axis?
yaxis	guess!
yscale	Change the scale of the y-axis?
size_column	Use a column for scaling the sizes of dots in the plot?
	extra options which may be used for plotting.

Value

```
a plot!
```

plot_pyprophet_data
Plot some data from the result of extract_peprophet_data()

Description

extract_pyprophet_data() provides a ridiculously large data table of a scored openswath data after processing by pyprophet.

Usage

```
plot_pyprophet_data(pyprophet_data, xaxis = "mass", xscale = NULL,
  yaxis = "leftwidth", yscale = NULL, alpha = 0.4, legend = TRUE,
  size_column = "mscore", ...)
```

Arguments

pyprophet_data List of pyprophet data, one element for each sample, taken from extract_peprophet_data() Column to plot on the x-axis xaxis xscale Change the scale of the x-axis? yaxis guess! yscale Change the scale of the y-axis? How see-through to make the dots? alpha legend Include a legend of samples? Use a column for scaling the sizes of dots in the plot? size_column extra options which may be used for plotting.

Value

a plot!

plot_pyprophet_distribution

Make a boxplot out of some of the various data available in the pyprophet data.

Description

This function is mostly redundant with the plot_mzxml_boxplot above. Unfortunately, the two data types are subtly different enough that I felt it not worth while to generalize the functions.

```
plot_pyprophet_distribution(pyprophet_data, column = "delta_rt",
  keep_real = TRUE, keep_decoys = TRUE, expt_names = NULL,
  label_chars = 10, title = NULL, scale = NULL, ...)
```

plot_qq_all 211

Arguments

pyprophet_data List containing the pyprophet results.

column What column of the pyprophet scored data to plot?

keep_real Do we keep the real data when plotting the data? (perhaps we only want the

decoys)

keep_decoys Do we keep the decoys when plotting the data?

expt_names Names for the x-axis of the plot.

label_chars Maximum number of characters before abbreviating sample names.

title Title the plot?

scale Put the data on a specific scale?

... Further arguments, presumably for colors or some such.

Value

Boxplot describing the desired column from the data.

plot_qq_all	Quantile/quantile comparison of the mean of all samples vs. each sam-
	ple.

Description

This allows one to visualize all individual data columns against the mean of all columns of data in order to see if any one is significantly different than the cloud.

Usage

```
plot_qq_all(data, labels = "short", ...)
```

Arguments

data Expressionset, expt, or dataframe of samples.

labels What kind of labels to print?

... Arguments passed presumably from graph_metrics().

Value

List containing: logs = a recordPlot() of the pairwise log qq plots. ratios = a recordPlot() of the pairwise ratio qq plots. means = a table of the median values of all the summaries of the qq plots.

See Also

Biobase

212 plot_rpm

-		
n	Lot	rmats
$ \mathbf{U}_{1}$	LUL	i ilia us

Given some psi and tpm data from suppa, make a pretty plot!

Description

This should take either a dataframe or filename for the psi data from suppa, along with the same for the average log tpm data (acquired from suppa diffSplice with –save_tpm_events)

Usage

```
plot_rmats(se = NULL, a5ss = NULL, a3ss = NULL, mxe = NULL,
  ri = NULL, sig_threshold = 0.05, dpsi_threshold = 0.7,
  label_type = NULL, alpha = 0.7)
```

Arguments

se T	Table of skipped exon data from rmats.
a5ss T	Table of alternate 5p exons.
a3ss T	Γable of alternate 3p exons.
mxe T	Γable of alternate exons.
ri T	Table of retained introns.
sig_threshold U	Jse this significance threshold.
dpsi_threshold U	Jse a delta threshold.
label_type C	Choose a type of event to label.
alpha H	How see-through should the points be in the plot?

Value

List containing the plot and some of the requisite data.

plot_rpm

Make relatively pretty bar plots of coverage in a genome.

Description

This was written for ribosome profiling coverage / gene. It should however, work for any data with little or no modification, it was also written when I was first learning R and when I look at it now I see a few obvious places which can use improvement.

```
plot_rpm(input, workdir = "images", output = "01.svg",
  name = "LmjF.01.0010", start = 1000, end = 2000, strand = 1,
  padding = 100)
```

plot_sample_heatmap 213

Arguments

input	Coverage / position filename.
workdir	Where to put the resulting images.

output Output image filename.

name Gene name to print at the bottom of the plot.
start Relative to 0, where is the gene's start codon.
end Relative to 0, where is the gene's stop codon.

strand Is this on the + or - strand? (+1/-1)

padding How much space to provide on the sides?

Value

coverage plot surrounging the ORF of interest

See Also

ggplot2

plot_sample_heatmap	Make a heatmap.3 description of the similarity of the genes among
	samples.

Description

Sometimes you just want to see how the genes of an experiment are related to each other. This can handle that. These heatmap functions should probably be replaced with neatmaps or heatplus or whatever it is, as the annotation dataframes in them are pretty awesome.

Usage

```
plot_sample_heatmap(data, colors = NULL, design = NULL,
    expt_names = NULL, row_label = NA, title = NULL, Rowv = TRUE,
    label_chars = 10, ...)
```

Arguments

1 4	Expt/expressionset/dataframe set of samples.
data	Hynt/aynraccioncat/datatrama cat of camples
uata	Expressionservational set of samples.

colors Color scheme of the samples (not needed if input is an expt).

design Design matrix describing the experiment (gotten for free if an expt).

expt_names Alternate samples names.

title Title of the plot!

Rowv Reorder the rows by expression?

label_chars Maximum number of characters before abbreviating sample names.

... More parameters for a good time!

214 plot_scatter

Value

a recordPlot() heatmap describing the samples.

See Also

RColorBrewer brewer.pal recordPlot

plot_scatter

Make a pretty scatter plot between two sets of numbers.

Description

This function tries to supplement a normal scatterplot with some information describing the relationship between the columns of data plotted.

Usage

```
plot_scatter(df, tooltip_data = NULL, color = "black",
   gvis_filename = NULL, size = 2)
```

Arguments

df Dataframe likely containing two columns.

tooltip_data Df of tooltip information for gvis. color Color of the dots on the graph.

gvis_filename Filename to write a fancy html graph.

size Size of the dots on the graph.

Value

Ggplot2 scatter plot.

See Also

```
ggplot2 googleVis plot_gvis_scatter geom_point plot_linear_scatter
```

plot_significant_bar 215

plot_significant_bar	Make a bar plot of the numbers of significant genes by contrast. These
	plots are quite difficult to describe.

Description

Make a bar plot of the numbers of significant genes by contrast. These plots are quite difficult to describe.

Usage

```
plot_significant_bar(ups, downs, maximum = NULL, text = TRUE,
  color_list = c("lightcyan", "lightskyblue", "dodgerblue", "plum1",
  "orchid", "purple4"), color_names = c("a_up_inner", "b_up_middle",
  "c_up_outer", "a_down_inner", "b_down_middle", "c_down_outer"))
```

Arguments

ups	Set of up-regulated genes.
downs	Set of down-regulated genes

maximum Maximum/minimum number of genes to display.

text Add text at the ends of the bars describing the number of genes >/< 0 fc.

color_list Set of colors to use for the bars.

color_names Categories associated with aforementioned colors.

Value

weird significance bar plots

See Also

```
ggplot2 extract_significant_genes
```

plot_single_qq	Perform a qaplot between two columns of a matrix.	
. – 6 – 11	3 1H	

Description

Given two columns of data, how well do the distributions match one another? The answer to that question may be visualized through a qq plot!

```
plot\_single\_qq(data, x = 1, y = 2, labels = TRUE)
```

216 plot_sm

Arguments

data Data frame/expt/expressionset.

x First column to compare.

y Second column to compare.

labels Include the lables?

Value

a list of the logs, ratios, and mean between the plots as ggplots.

See Also

Biobase

plot_sm	Make an R plot of the standard median correlation or distance among samples.
	•

Description

This was written by a mix of Kwame Okrah <kokrah at gmail dot com>, Laura Dillon <dillonl at umd dot edu>, and Hector Corrada Bravo <hcorrada at umd dot edu> I reimplemented it using ggplot2 and tried to make it a little more flexible. The general idea is to take the pairwise correlations/distances of the samples, then take the medians, and plot them. This version of the plot is no longer actually a dotplot, but a point plot, but who is counting?

Usage

```
plot_sm(data, colors = NULL, method = "pearson", plot_legend = FALSE,
  expt_names = NULL, label_chars = 10, title = NULL, dot_size = 5,
    ...)
```

Arguments

data Expt, expressionset, or data frame. colors Color scheme if data is not an expt. method Correlation or distance method to use. plot_legend Include a legend on the side? Use pretty names for the samples? expt_names label_chars Maximum number of characters before abbreviating sample names. title Title for the graph. dot_size How large should the glyphs be? More parameters to make you happy!

plot_spirograph 217

Value

ggplot of the standard median something among the samples. This will also write to an open device. The resulting plot measures the median correlation of each sample among its peers. It notes 1.5* the interquartile range among the samples and makes a horizontal line at that correlation coefficient. Any sample which falls below this line is considered for removal because it is much less similar to all of its peers.

See Also

matrixStats grDevices hpgl_cor rowMedians quantile diff recordPlot

Examples

```
## Not run:
   smc_plot = hpgl_smc(expt=expt)
## End(Not run)
```

plot_spirograph

Make spirographs!

Description

Taken (with modifications) from: http://menugget.blogspot.com/2012/12/spirograph-with-r.html#more A positive value for 'B' will result in a epitrochoid, while a negative value will result in a hypotrochoid.

Usage

```
plot_spirograph(radius_a = 1, radius_b = -4, dist_bc = -2,
  revolutions = 158, increments = 3160, center_a = list(x = 0, y =
  0))
```

Arguments

radius_b The radius of the circle travelling around a. dist_bc A point relative to the center of 'b' which rotates with the turning of 'b' revolutions How many revolutions to perform in the plot increments The number of radial increments to be calculated per revolution center_a The position of the center of 'a'.	radius_a	The radius of the primary circle.
revolutions How many revolutions to perform in the plot increments The number of radial increments to be calculated per revolution	radius_b	The radius of the circle travelling around a.
increments The number of radial increments to be calculated per revolution	dist_bc	A point relative to the center of 'b' which rotates with the turning of 'b'.
1	revolutions	How many revolutions to perform in the plot
center_a The position of the center of 'a'.	increments	The number of radial increments to be calculated per revolution
	center_a	The position of the center of 'a'.

Value

something which I don't yet know.

218 plot_svfactor

plot_suppa	Given some psi and tpm data, make a pretty plot!	

Description

This should take either a dataframe or filename for the psi data from suppa, along with the same for the average log tpm data (acquired from suppa diffSplice with –save_tpm_events)

Usage

```
plot_suppa(dpsi, tpm, events = NULL, psi = NULL,
    sig_threshold = 0.05, label_type = NULL, alpha = 0.7)
```

Arguments

dpsi Table provided by suppa containing all the metrics.

tpm Table provided by suppa containing all the tpm values.

events List of event types to include.

psi Limit the set of included events by psi value?

sig_threshold Use this significance threshold.

label_type Choose a type of event to label.

alpha How see-through should the points be in the plot?

Value

List containing the plot and some of the requisite data.

•	Make a dotplot of some categorised factors and a set of SVs (for other factors).
---	--

Description

This should make a quick df of the factors and surrogates and plot them.

Usage

```
plot_svfactor(expt, svest, sv = 1, chosen_factor = "batch",
  factor_type = "factor")
```

plot_topgo_densities 219

Arguments

expt Experiment from which to acquire the design, counts, etc.

svest Set of surrogate variable estimations from sva/svg or batch estimates.

chosen_factor Factor to compare against.

factor_type This may be a factor or range, it is intended to plot a scatterplot if it is a range,

a dotplot if a factor.

Value

surrogate variable plot as per Leek's work

See Also

ggplot2

Examples

```
## Not run:
    estimate_vs_snps <- plot_svfactor(start, surrogate_estimate, "snpcategory")
## End(Not run)</pre>
```

Description

This can make a large number of plots.

Usage

```
plot_topgo_densities(godata, table)
```

Arguments

godata Result from topgo. table Table of genes.

Value

density plot as per topgo

See Also

topGO

220 plot_topn

plot_topgo_pval

Make a pvalue plot from topgo data.

Description

The p-value plots from clusterProfiler are pretty, this sets the topgo data into a format suitable for plotting in that fashion and returns the resulting plots of significant ontologies.

Usage

```
plot_topgo_pval(topgo, wrapped_width = 20, cutoff = 0.1, n = 30,
  type = "fisher", ...)
```

Arguments

topgo Some data from topgo!

wrapped_width Maximum width of the text names.

cutoff P-value cutoff for the plots.

n Maximum number of ontologies to include.

type Type of score to use.

... arguments passed through presumably from simple_topgo()

Value

List of MF/BP/CC pvalue plots.

See Also

topgo clusterProfiler

plot_topn

Plot the representation of the top-n genes in the total counts / sample.

Description

One question we might ask is: how much do the most abundant genes in a samples comprise the entire sample? This plot attempts to provide a visual hint toward answering this question. It does so by rank-ordering all the genes in every sample and dividing their counts by the total number of reads in that sample. It then smooths the points to provide the resulting trend. The steeper the resulting line, the more over-represented these top-n genes are. I suspect, but haven't tried yet, that the inflection point of the resulting curve is also a useful diagnostic in this question.

plot_tsne 221

Usage

```
plot_topn(data, title = NULL, num = 100, expt_names = NULL,
    plot_labels = "direct", label_chars = 10, plot_legend = FALSE, ...)
```

Arguments

data Dataframe/matrix/whatever for performing topn-plot.

title A title for the plot.

num The N in top-n genes, if null, do them all.

expt_names Column or character list of sample names.

plot_labels Method for labelling the lines.

label_chars Maximum number of characters before abbreviating samples.

plot_legend Add a legend to the plot?

... Extra arguments, currently unused.

Value

List containing the ggplot2

Description

Shortcut to plot_pca(pc_method="tsne")

Usage

```
plot_tsne(...)
```

Arguments

... Arguments for plot_pca()

222 plot_volcano_de

```
plot_variance_coefficients
```

Look at the (biological)coefficient of variation/quartile coefficient of dispersion with respect to an experimental factor.

Description

I want to look at the (B)CV of some data with respect to condition/batch/whatever. This function should make that possible, with some important caveats. The most appropriate metric is actually the biological coefficient of variation as calculated by DESeq2/EdgeR; but the metrics I am currently taking are the simpler and less appropriate CV(sd/mean) and QCD(q3-q1/q3+q1).

Usage

```
plot_variance_coefficients(data, x_axis = "condition", colors = NULL,
    title = NULL, ...)
```

Arguments

data	Expressionset/epxt to poke at.
x_axis	Factor in the experimental design we may use to group the data and calculate the dispersion metrics.
colors	Set of colors to use when making the violins
title	Optional title to include with the plot.
	Extra arguments to pass along.

Value

List of plots showing the coefficients vs. genes along with the data.

plot_volca	ano_de Make a pretty Volcano

Description

Volcano plots and MA plots provide quick an easy methods to view the set of (in)significantly differentially expressed genes. In the case of a volcano plot, it places the -log10 of the p-value estimate on the y-axis and the fold-change between conditions on the x-axis. Here is a neat snippet from wikipedia: "The concept of volcano plot can be generalized to other applications, where the x-axis is related to a measure of the strength of a statistical signal, and y-axis is related to a measure of the statistical significance of the signal."

plot_volcano_de 223

Usage

```
plot_volcano_de(table, alpha = 0.6, color_by = "p",
    color_list = c(`FALSE` = "darkred", `TRUE` = "darkblue"),
    fc_col = "logFC", fc_name = "log2 fold change",
    gvis_filename = NULL, line_color = "black",
    line_position = "bottom", logfc = 1, p_col = "adj.P.Val",
    p_name = "-log10 p-value", p = 0.05, shapes_by_state = TRUE,
    size = 2, tooltip_data = NULL, ...)
```

Arguments

table Dataframe from limma's toptable which includes log(fold change) and an ad-

justed p-value.

alpha How transparent to make the dots.

color_by By p-value something else?
color_list List of colors for significance.

fc_col Which column contains the fc data?

fc_name Name of the fold-change to put on the plot.

gvis_filename Filename to write a fancy html graph.
line_color What color for the significance lines?

line_position Put the significance lines above or below the dots?

logfc Cutoff defining the minimum/maximum fold change for interesting.

p_col Which column contains the p-value data?

p_name Name of the p-value to put on the plot.

Cutoff defining significant from not

p Cutoff defining significant from not.

shapes_by_state

Add fun shapes for the various significance states?

size How big are the dots?

... I love parameters!

Value

Ggplot2 volcano scatter plot. This is defined as the -log10(p-value) with respect to log(fold change). The cutoff values are delineated with lines and mark the boundaries between 'significant' and not. This will make a fun clicky googleVis graph if requested.

See Also

limma plot_gvis_ma toptable voom hpgl_voom lmFit makeContrasts contrasts.fit

Examples

```
## Not run:
plot_volcano_de(table, gvis_filename="html/fun_ma_plot.html")
## Currently this assumes that a variant of toptable was used which
## gives adjusted p-values. This is not always the case and I should
## check for that, but I have not yet.

## End(Not run)
```

post_eupath_annotations

Gather all available annotation data for a given eupathdb species.

Description

This function fills in the parameters to post_eupath_raw() so that one can download all the available data for a given parasite into one massive table. It should also provide some constraints to the data rather than leaving it all as characters. Caveat: I manually filled in the list 'field_list' to include the variable names and their text associations. This is likely to change in future releases of the tritrypdb. It is probably possible to automagically fill it in. In addition, I am using GenesByMolecularWeight to get the data, which is a bit weird.

Usage

```
post_eupath_annotations(species = "Leishmania major", entry = NULL,
  metadata = NULL, dir = "eupathdb", ...)
```

Arguments

species guess.

entry The full annotation entry.

metadata A metadata table from which to get some annotation data.

dir FIXME: I want to write some intermediate data to dir in case of transient error.

... Used for downloading metadata.

Value

A big honking table.

post_eupath_go_table 225

post_eupath_go_table Use the post interface to get GO data.

Description

Use the post interface to get GO data.

Usage

```
post_eupath_go_table(species = "Leishmania major", entry = NULL,
  metadata = NULL, dir = "eupathdb", ...)
```

Arguments

species guess.

entry The full annotation entry.

metadata A metadata table from which to get some annotation data.

dir FIXME: I want to write some intermediate data to dir in case of transient error.

... Extra options when downloading metadata.

Value

A big honking table.

```
post_eupath_interpro_table
```

Use the post interface to get interpro data.

Description

Use the post interface to get interpro data.

Usage

```
post_eupath_interpro_table(species = "Leishmania major strain Friedlin",
  entry = NULL, metadata = NULL, dir = "eupathdb", ...)
```

Arguments

species guess.

entry The full annotation entry.

metadata A metadata table from which to get some annotation data.

dir FIXME: I want to write some intermediate data to dir in case of transient error.

. . . Extra options when downloading metadata.

Value

A big honking table.

```
post_eupath_ortholog_table
```

Use the post interface to get ortholog data.

Description

Use the post interface to get ortholog data.

Usage

```
post_eupath_ortholog_table(species = "Leishmania major", entry = NULL,
  metadata = NULL, dir = "eupathdb", ...)
```

Arguments

species guess.

entry The full annotation entry.

dir FIXME: I want to write some intermediate data to dir in case of transient error.

... Extra options for downloading metadata.

Value

A big honking table.

```
post_eupath_pathway_table
```

 ${\it Use the post interface to get pathway data}.$

Description

Use the post interface to get pathway data.

Usage

```
post_eupath_pathway_table(species = "Leishmania major", entry = NULL,
  metadata = NULL, dir = "eupathdb", ...)
```

post_eupath_raw 227

Arguments

species guess.

entry The full annotation entry.

metadata A metadata table from which to get some annotation data.

dir FIXME: I want to write some intermediate data to dir in case of transient error.

... Extra options when downloading metadata

Value

A big honking table.

post_eupath_raw	The new eupath system provides 3 output types for downloading data.
	This uses the raw one.

Description

For the life of me, I could not figure out how to query the big text tables as the tabular format. Every query I sent came back telling me I gave it incorrect parameter despite the fact that I was copy/pasting the example given me by the eupathdb maintainers. So, I got mad and asked it for the raw format, and so this function was born.

Usage

```
post_eupath_raw(entry, question = "GeneQuestions.GenesByMolecularWeight",
  parameters = NULL, table_name = NULL, columns = NULL,
  minutes = 40)
```

Arguments

entry Annotation entry for a given species

question Which query to try? Molecular weight is the easiest, as it was their example.

parameters Query parameters when posting

table_name Used to make sure all columns are unique by prefixing them with the table name.

columns Columns for which to ask.

minutes How long to wait until giving up and throwing an error.

Value

A hopefully huge table of eupath data.

228 post_eupath_table

post_eupath_table	Queries one of the EuPathDB APIs using a POST request and returns a
	dataframe representation of the result. Note: As of 2017/07/13, POST
	requests are not yet supported on EuPathDB. Note: 2017/07/13 POST
	queries can only use the new API

Description

Queries one of the EuPathDB APIs using a POST request and returns a dataframe representation of the result. Note: As of 2017/07/13, POST requests are not yet supported on EuPathDB. Note: 2017/07/13 POST queries can only use the new API

Usage

```
post_eupath_table(query_body, species = NULL, entry = NULL,
  metadata = NULL, table_name = NULL, minutes = 30, ...)
```

Arguments

species Species name if missing an entry	
entry The single metadatum containing the base url of the provider, species, etc.	
metadata	
table_name The name of the table to extract, this is provided to make for prettier labeling	3.
minutes A timeout when querying the eupathdb.	
Extra arguments for stuff like download_metadtata()	

Value

```
list containing response from API request.

More information ——————————————————————1. https://tritrypdb.org/tritrypdb/serviceList.jsp
```

Author(s)

Keith Hughitt

pp 229

pp

Plot a picture, with hopefully useful options for most(any) format.

Description

This calls svg/png/postscript/etc according to the filename provided.

Usage

```
pp(file, image = NULL, width = 9, height = 9, res = 180, ...)
```

Arguments

file	Filename to write
image	Optionally, add the image you wish to plot and this will both print it to file and screen.
width	How wide?
height	How high?
res	The chosen resolution.
	Arguments passed to the image plotters.

Value

a png/svg/eps/ps/pdf with height=width=9 inches and a high resolution

print_ups_downs

 $Reprint\ the\ output\ from\ extract_significant_genes().$

Description

I found myself needing to reprint these excel sheets because I added some new information. This shortcuts that process for me.

Usage

```
print_ups_downs(upsdowns, wb = NULL,
  excel = "excel/significant_genes.xlsx", according = "limma",
  summary_count = 1, ma = FALSE)
```

230 random_ontology

Arguments

upsdowns Output from extract_significant_genes().

wb Workbook object to use for writing, or start a new one.

excel Filename for writing the data.

summary_count For spacing sequential tables one after another.

ma Include ma plots?

Value

Return from write_xls.

See Also

```
combine_de_tables
```

random_ontology

Perform a simple_ontology() on some random data.

Description

At the very least, the result should be less significant than the actual data!

Usage

```
random_ontology(input, method = "goseq", n = 200, ...)
```

Arguments

input Some input data

method goseq, clusterp, topgo, gostats, gprofiler.

n how many 'genes' to analyse?

... Arguments passed to the method.

Value

An ontology result

rank_order_scatter 231

rank_order_scatter

Plot the rank order of the data in two tables against each other.

Description

Steve Christensen has some neat plots showing the relationship between two tables. I though they were super-cool, so I co-opted the idea in this function.

Usage

```
rank_order_scatter(first, second = NULL, first_type = "limma",
  second_type = "limma", first_table = 1, alpha = 0.5,
  second_table = 2, first_column = "logFC", second_column = "logFC",
  first_p_col = "adj.P.Val", second_p_col = "adj.P.Val",
  p_limit = 0.05, both_color = "red", first_color = "green",
  second_color = "blue", no_color = "black")
```

Arguments

first	First table of values.
second	Second table of values, if null it will use the first.
first_type	Assuming this is from all_pairwise(), use this method.
second_type	Ibid.
first_table	Again, assuming all_pairwise(), use this to choose the table to extract.
alpha	How see-through to make the dots?
second_table	Ibid.
first_column	What column to use to rank-order from the first table?
second_column	What column to use to rank-order from the second table?
first_p_col	Use this column for pretty colors from the first table.
second_p_col	Use this column for pretty colors from the second table.
p_limit	A p-value limit for coloring dots.
both_color	If both columns are 'significant', use this color.
first_color	If only the first column is 'significant', this color.
second_color	If the second column is 'significant', this color.
no_color	If neither column is 'significant', then this color.

Value

a list with a plot and a couple summary statistics.

232 read_counts_expt

read_counts_expt	Read a bunch of count tables and create a usable data frame from them.

Description

It is worth noting that this function has some logic intended for the elsayed lab's data storage structure. It shouldn't interfere with other usages, but it attempts to take into account different ways the data might be stored.

Usage

```
read_counts_expt(ids, files, header = FALSE,
  include_summary_rows = FALSE, suffix = NULL, ...)
```

Arguments

ids List of experimental ids.

files List of files to read.

header Whether or not the count tables include a header row.
include_summary_rows

Whether HTSeq summary rows should be included.

suffix Optional suffix to add to the filenames when reading them.

... More options for happy time!

Details

Used primarily in create_expt() This is responsible for reading count tables given a list of filenames. It tries to take into account upper/lowercase filenames and uses data.table to speed things along.

Value

Data frame of count tables.

See Also

```
data.table create_expt
```

Examples

```
## Not run:
count_tables <- hpgl_read_files(as.character(sample_ids), as.character(count_filenames))
## End(Not run)</pre>
```

read_metadata 233

read_metadata

Given a table of meta data, read it in for use by create_expt().

Description

Reads an experimental design in a few different formats in preparation for creating an expt.

Usage

```
read_metadata(file, ...)
```

Arguments

file Csv/xls file to read.

... Arguments for arglist, used by sep, header and similar read_csv/read.table pa-

rameters.

Value

Df of metadata.

See Also

tools openxlsx XLConnect

read_snp_columns

Read the output from bcfutils into a count-table-esque

Description

I put all my befutils output files into one directory, so hunt them down and read them into a data table.

Usage

```
read_snp_columns(samples, input_dir = "preprocessing/outputs",
  file_suffix = "_parsed_ratio.txt")
```

Arguments

samples Sample names to read

input_dir Directory from which to read them. file_suffix The suffix of my output files.

Value

A big honking data table.

234 recolor_points

Description

The Thermo(TM) workflow has as its default a fascinatingly horrible excel output. This function parses that into a series of data frames.

Usage

```
read_thermo_xlsx(xlsx_file, test_row = NULL)
```

Arguments

xlsx_file The input xlsx file

test_row A single row in the xlsx file to use for testing, as I have not yet seen two of these

accursed files which had the same headers.

Value

List containing the protein names, group data, protein dataframe, and peptide dataframe.

recolor_points	Quick point-recolorizer given an existing plot, df, list of rownames to
	recolor, and a color.

Description

This function should make it easy to color a family of genes in any of the point plots.

Usage

```
recolor_points(plot, df, ids, color = "red", ...)
```

Arguments

plot	Geom_point based plot
df	Data frame used to create the plot
ids	Set of ids which must be in the rownames of df to recolor
color	Chosen color for the new points.
	Extra arguments are passed to arglist.

Value

prettier plot.

renderme 235

renderme	Add a little logic to rmarkdown::render to date the final outputs as per
	a request from Najib.

Description

Add a little logic to rmarkdown::render to date the final outputs as per a request from Najib.

Usage

```
renderme(file, format = "html_document")
```

Arguments

file Rmd file to render. format Chosen file format.

Value

Final filename including the prefix rundate.

```
replot_varpart_percent
```

A shortcut for replotting the percent plots from variancePartition.

Description

In case I wish to look at different numbers of genes from variancePartition and/or different columns to sort from.

Usage

```
replot_varpart_percent(varpart_output, n = 30, column = NULL,
  decreasing = TRUE)
```

Arguments

varpart_output List returned by varpart()
n How many genes to plot.

column The df column to use for sorting.

decreasing high->low or vice versa?

Value

The percent variance bar plots from variancePartition!

See Also

variancePartition plotPercentBars

rex	Resets the display and xauthority variables to the new computer I am using so that plot() works.

Description

This function assumes a line in the .profile which writes the DISPLAY variable to \$HOME/.displays/\$(hostname).last

Usage

```
rex(display = ":0")
```

Arguments

display DISPLAY variable to use, if NULL it looks in ~/.displays/\$(host).last

Description

This is horrifyingly slow.

Usage

```
samtools_snp_coverage(expt, type = "counts",
  input_dir = "preprocessing/outputs", tolower = TRUE,
  bam_suffix = ".bam")
```

Arguments

expt Expressionset to analyze

type counts or percent?

input_dir Directory containing the samtools results.

tolower lowercase the sample names? bam_suffix In case the data came from sam.

Value

It is so slow I no longer know if it works.

sanitize_expt 237

sanitize_expt	Get rid of characters which will mess up contrast making and such before playing with an expt.

Description

Get rid of characters which will mess up contrast making and such before playing with an expt.

Usage

```
sanitize_expt(expt)
```

Arguments

expt

An expt object to clean.

saveme

Make a backup rdata file for future reference

Description

I often use R over a sshfs connection, sometimes with significant latency, and I want to be able to save/load my R sessions relatively quickly. Thus this function uses pxz to compress the R session maximally and relatively fast. This assumes you have pxz installed and >= 4 CPUs.

Usage

```
saveme(directory = "savefiles", backups = 2, cpus = 6,
  filename = "Rdata.rda.xz")
```

Arguments

directory Directory to save the Rdata file.

backups How many revisions?

cpus How many cpus to use for the xz call

filename Choose a filename.

Value

Command string used to save the global environment.

See Also

```
save pipe
```

Examples

```
## Not run:
    saveme()
## End(Not run)
```

semantic_copynumber_extract

Extract multicopy genes from up/down gene expression lists.

Description

The function semantic_copynumber_filter() is the inverse of this.

Usage

```
semantic_copynumber_extract(...)
```

Arguments

.. Arguments for semantic_copynumber_filter()

Details

Currently untested, used for Trypanosome analyses primarily, thus the default strings.

```
semantic_copynumber_filter
```

 $Remove\ multicopy\ genes\ from\ up/down\ gene\ expression\ lists.$

Description

In our parasite data, there are a few gene types which are consistently obnoxious. Multi-gene families primarily where the coding sequences are divergent, but the UTRs nearly identical. For these genes, our sequence based removal methods fail and so this just excludes them by name.

Usage

```
semantic_copynumber_filter(input, max_copies = 2, use_files = FALSE,
invert = TRUE, semantic = c("mucin", "sialidase", "RHS", "MASP",
    "DGF", "GP63"), semantic_column = "1.tooltip")
```

semantic_expt_filter 239

Arguments

input List of sets of genes deemed significantly up/down with a column expressing

approximate count numbers.

max_copies Keep only those genes with <= n putative copies.

invert Keep these genes rather than drop them? semantic Set of strings with gene names to exclude.

semantic_column

Column in the DE table used to find the semantic strings for removal.

Details

Currently untested, used for Trypanosome analyses primarily, thus the default strings.

Value

Smaller list of up/down genes.

See Also

```
semantic_copynumber_extract
```

Examples

```
## Not run:
    pruned <- semantic_copynumber_filter(table, semantic=c("ribosomal"))
    ## Get rid of all genes with 'ribosomal' in the annotations.
## End(Not run)</pre>
```

 ${\tt semantic_expt_filter} \quad \textit{Remove/keep specifically named genes from an expt.}$

Description

I find subsetting weirdly confusing. Hopefully this function will allow one to include/exclude specific genes/families based on string comparisons.

Usage

```
semantic_expt_filter(input, invert = FALSE, topn = NULL,
  semantic = c("mucin", "sialidase", "RHS", "MASP", "DGF", "GP63"),
  semantic_column = "description")
```

240 sequence_attributes

Arguments

input Expt to filter.

invert Keep only the things with the provided strings (TRUE), or remove them (FALSE).

topn Take the topn most abundant genes rather than a text based heuristic.

semantic Character list of strings to search for in the annotation data.

semantic_column

Column in the annotations to search.

Value

A presumably smaller expt.

sequence_attributes

Gather some simple sequence attributes.

Description

This extends the logic of the pattern searching in pattern_count_genome() to search on some other attributes.

Usage

```
sequence_attributes(fasta, gff = NULL, type = "gene", key = NULL)
```

Arguments

fasta Genome encoded as a fasta file.

optional gff of annotations (if not provided it will just ask the whole genome).

type Column of the gff file to use.

key What type of entry of the gff file to key from?

Value

List of data frames containing gc/at/gt/ac contents.

Author(s)

atb

Biostrings Rsamtools FaFile getSeq

set_expt_batches 241

Examples

```
## Not run:
   num_pattern = sequence_attributes('mgas_5005.fasta', 'mgas_5005.gff')
## End(Not run)
```

set_expt_batches

Change the batches of an expt.

Description

When exploring differential analyses, it might be useful to play with the conditions/batches of the experiment. Use this to make that easier.

Usage

```
set_expt_batches(expt, fact, ids = NULL, ...)
```

Arguments

expt	Expt to modify.
fact	Batches to replace using this factor.
ids	Specific samples to change.
	Extra options are like spinach.

Value

The original expt with some new metadata.

See Also

```
create_expt set_expt_conditions
```

Examples

```
## Not run:
    expt = set_expt_batches(big_expt, factor=c(some,stuff,here))
## End(Not run)
```

242 set_expt_colors

set_expt_colors

Change the colors of an expt

Description

When exploring differential analyses, it might be useful to play with the conditions/batches of the experiment. Use this to make that easier.

Usage

```
set_expt_colors(expt, colors = TRUE, chosen_palette = "Dark2",
   change_by = "condition")
```

Arguments

expt Expt to modify colors colors to replace

change_by Assuming a list is passed, cross reference by condition or sample?

Value

expt Send back the expt with some new metadata

See Also

```
set_expt_conditions set_expt_batches
```

Examples

```
## Not run:
unique(esmer_expt$design$conditions)
chosen_colors <- list(
    "cl14_epi" = "#FF8D59",
    "clbr_epi" = "#962F00",
    "cl14_tryp" = "#D06D7F",
    "clbr_tryp" = "#A4011F",
    "clt_late" = "#6BD35E",
    "clbr_late" = "#1E7712",
    "clt_mid" = "#7280FF",
    "clbr_mid" = "#000D7E")
esmer_expt <- set_expt_colors(expt=esmer_expt, colors=chosen_colors)
## End(Not run)</pre>
```

set_expt_conditions 243

set_expt_conditions Change the condition of an expt

Description

When exploring differential analyses, it might be useful to play with the conditions/batches of the experiment. Use this to make that easier.

Usage

```
set_expt_conditions(expt, fact = NULL, ids = NULL, ...)
```

Arguments

expt	Expt to modify
fact	Conditions to replace
ids	Specific sample IDs to change.
	Extra arguments are given to arglist.

Value

expt Send back the expt with some new metadata

See Also

```
set_expt_batches create_expt
```

Examples

```
## Not run:
    expt = set_expt_conditions(big_expt, factor=c(some,stuff,here))
## End(Not run)
```

set_expt_factors

Change the factors (condition and batch) of an expt

Description

When exploring differential analyses, it might be useful to play with the conditions/batches of the experiment. Use this to make that easier.

Usage

```
set_expt_factors(expt, condition = NULL, batch = NULL, ids = NULL,
...)
```

Arguments

expt Expt to modify
condition New condition factor
batch New batch factor

ids Specific sample IDs to change.

... Arguments passed along (likely colors)

Value

expt Send back the expt with some new metadata

See Also

```
set_expt_conditions set_expt_batches
```

Examples

```
## Not run:
    expt = set_expt_factors(big_expt, condition="column", batch="another_column")
## End(Not run)
```

Description

Sometimes one does not like the hpgl identifiers, so provide a way to change them on-the-fly.

Usage

```
set_expt_samplenames(expt, newnames)
```

Arguments

expt Expt to modify

newnames New names, currently only a character vector.

Value

expt Send back the expt with some new metadata

See Also

```
set_expt_conditions set_expt_batches
```

significant_barplots 245

Examples

```
## Not run:
    expt = set_expt_samplenames(expt, c("a","b","c","d","e","f"))
## End(Not run)
```

significant_barplots

Given the set of significant genes from combine_de_tables(), provide a view of how many are significant up/down.

Description

These plots are pretty annoying, and I am certain that this function is not well written, but it provides a series of bar plots which show the number of genes/contrast which are up and down given a set of fold changes and p-value.

Usage

```
significant_barplots(combined, lfc_cutoffs = c(0, 1, 2),
invert = FALSE, p = 0.05, z = NULL, p_type = "adj",
according_to = "all", order = NULL, maximum = NULL, ...)
```

Arguments

combined	Result from combine_de_tables and/or extract_significant_genes().	
lfc_cutoffs	Choose 3 fold changes to define the queries. 0, 1, 2 mean greater/less than 0 followed by 2 fold and 4 fold cutoffs.	
invert	Reverse the order of contrasts for readability?	
p	Chosen p-value cutoff.	
Z	Choose instead a z-score cutoff.	
p_type	Adjusted or not?	
according_to	limma, deseq, edger, basic, or all of the above.	
order	er Choose a specific order for the plots.	
maximum	Set a specific limit on the number of genes on the x-axis.	
	More arguments are passed to arglist.	

Value

list containing the significance bar plots and some information to hopefully help interpret them.

See Also

ggplot2

246 sig_ontologies

Examples

```
## Not run:
    ## Damn I wish I were smrt enough to make this elegant, but I cannot.
    barplots <- significant_barplots(combined_result)
## End(Not run)</pre>
```

sig_ontologies

Take the result from extract_significant_genes() and perform ontology searches.

Description

It can be annoying/confusing to extract individual sets of 'significant' genes from a differential expression analysis. This function should make that process easier.

Usage

```
sig_ontologies(significant_result, excel_prefix = "excel/sig_ontologies",
  search_by = "deseq", excel_suffix = ".xlsx", type = "gprofiler",
  ...)
```

Arguments

```
significant_result
Result from extract_siggenes()

excel_prefix How to start the output filenames?

search_by Use the definition of 'significant' from which program?

excel_suffix How to end the excel filenames?

type Which specific ontology search to use?

Arguments passed to the various simple_ontology() function.
```

Value

A list of the up/down results of the ontology searches.

sillydist 247

sillydist

Calculate a simplistic distance function of a point against two axes.

Description

Sillydist provides a distance of any point vs. the axes of a plot. This just takes the abs(distances) of each point to the axes, normalizes them against the largest point on the axes, multiplies the result, and normalizes against the max of all point.

Usage

```
sillydist(firstterm, secondterm, firstaxis = 0, secondaxis = 0)
```

Arguments

firstterm X-values of the points.
secondterm Y-values of the points.
firstaxis X-value of the vertical axis.
secondaxis Y-value of the second axis.

Value

Dataframe of the distances.

See Also

ggplot2

Examples

```
## Not run:
mydist <- sillydist(df[,1], df[,2], first_median, second_median)</pre>
first_vs_second <- ggplot2::ggplot(df, ggplot2::aes_string(x="first", y="second"),</pre>
                                     environment=hpgl_env) +
  ggplot2::xlab(paste("Expression of", df_x_axis)) +
  ggplot2::ylab(paste("Expression of", df_y_axis)) +
 ggplot2::geom_vline(color="grey", xintercept=(first_median - first_mad), size=line_size) +
 \verb|ggplot2::geom_vline| (color="grey", xintercept=(first\_median + first\_mad), size=line\_size) + \\
  ggplot2::geom_vline(color="darkgrey", xintercept=first_median, size=line_size) +
 ggplot2::geom_hline(color="grey", yintercept=(second_median - second_mad), size=line_size) +
 ggplot2::geom_hline(color="grey", yintercept=(second_median + second_mad), size=line_size) +
  ggplot2::geom_hline(color="darkgrey", yintercept=second_median, size=line_size) +
  ggplot2::geom_point(colour=grDevices::hsv(mydist$dist, 1, mydist$dist),
                       alpha=0.6, size=size) +
  ggplot2::theme(legend.position="none")
first_vs_second ## dots get colored according to how far they are from the medians
## replace first_median, second_median with 0,0 for the axes
## End(Not run)
```

```
simple_clusterprofiler
```

Perform the array of analyses in the 2016-04 version of clusterProfiler

Description

The new version of clusterProfiler has a bunch of new toys. However, it is more stringent in terms of input in that it now explicitly expects to receive annotation data in terms of a orgdb object. This is mostly advantageous, but will probably cause some changes in the other ontology functions in the near future. This function is an initial pass at making something similar to my previous 'simple_clusterprofiler()' but using these new toys.

Usage

```
simple_clusterprofiler(sig_genes, de_table = NULL,
  orgdb = "org.Dm.eg.db", orgdb_from = NULL, orgdb_to = "ENTREZID",
  go_level = 3, pcutoff = 0.05, qcutoff = 0.1, fc_column = "logFC",
  second_fc_column = "limma_logfc", updown = "up",
  permutations = 100, min_groupsize = 5, kegg_prefix = NULL,
  kegg_organism = NULL, do_gsea = TRUE, categories = 12,
  excel = NULL, do_david = FALSE, david_id = "ENTREZ_GENE_ID",
  david_user = "unknown@unknown.org")
```

Arguments

sig_genes	ig_genes Dataframe of genes deemed 'significant.'	
de_table	Dataframe of all genes in the analysis, primarily for gse analyses.	
orgdb	Name of the orgDb used for gathering annotation data.	
orgdb_from	Name of a key in the orgdb used to cross reference to entrez IDs.	
orgdb_to	List of keys to grab from the orgdb for cross referencing ontologies.	
go_level How deep into the ontology tree should this dive for over expressed categories		
pcutoff P-value cutoff for 'significant' analyses.		
qcutoff Q-value cutoff for 'significant' analyses.		
fc_column When extracting vectors of all genes, what column should be used?		
second_fc_column		
	When extracting vectors of all genes, what column should be tried the second time around?	
updown Include the less than expected ontologies?		
permutations How many permutations for GSEA-ish analyses?		
min_groupsize Minimum size of an ontology before it is included.		
kegg_prefix	Many KEGG ids need a prefix before they will cross reference.	
kegg_organism Choose the 3 letter KEGG organism name here.		

simple_cp_enricher 249

do_gsea	Perform gsea	searches?
40_ <u>6</u> 004	I CIIOIIII SOCC	bearenes.

categories How many categories should be plotted in bar/dot plots?

excel Print the results to an excel file?

do_david Attempt to use the DAVID database for a search?

david_id Which column to use for cross-referencing to DAVID?

david_user Default registered username to use.

Value

a list

See Also

clusterProfiler

Examples

```
## Not run:
holyasscrackers <- simple_clusterprofiler(gene_list, all_genes, "org.Dm.eg.db")
## End(Not run)</pre>
```

simple_cp_enricher

Generic enrichment using clusterProfiler.

Description

culsterProfiler::enricher provides a quick and easy enrichment analysis given a set of siginficant' genes and a data frame which connects each gene to a category.

Usage

```
simple_cp_enricher(sig_genes, de_table, go_db = NULL)
```

Arguments

sig_genes Set of 'significant' genes as a table.

de_table All genes from the original analysis.

go_db Dataframe of GO->ID matching the gene names of sig_genes to GO categories.

Value

Table of 'enriched' categories.

250 simple_gadem

simple_filter_counts Filter low-count genes from a data set only using a simple threshold and number of samples.

Description

This was a function written by Kwame Okrah and perhaps also Laura Dillon to remove low-count genes. It drops genes based on a threshold and number of samples.

Usage

```
simple_filter_counts(count_table, threshold = 2)
```

Arguments

count_table Data frame of (pseudo)counts by sample.
threshold Lower threshold of counts for each gene.

Value

Dataframe of counts without the low-count genes.

See Also

edgeR

Examples

```
## Not run:
  filtered_table <- simple_filter_counts(count_table)
## End(Not run)</pre>
```

simple_gadem

run the rGADEM suite

Description

This should provide a set of rGADEM results given an input file of sequences and a genome.

Usage

```
simple_gadem(inputfile, genome = "BSgenome.Hsapiens.UCSC.hs19", ...)
```

simple_goseq 251

Arguments

inputfile Fasta or bed file containing sequences to search.

genome BSgenome to read.

... Parameters for plotting the gadem result.

Value

A list containing slots for plots, the stdout output from gadem, the gadem result, set of occurences of motif, and the returned set of motifs.

simple_goseq

Perform a simplified goseq analysis.

Description

goseq can be pretty difficult to get set up for non-supported organisms. This attempts to make that process a bit simpler as well as give some standard outputs which should be similar to those returned by clusterprofiler/topgo/gostats/gprofiler.

Usage

```
simple_goseq(sig_genes, go_db = NULL, length_db = NULL,
  doplot = TRUE, adjust = 0.1, pvalue = 0.1,
  length_keytype = "transcripts", go_keytype = "entrezid",
  goseq_method = "Wallenius", padjust_method = "BH",
  bioc_length_db = "ensGene", excel = NULL, ...)
```

Arguments

sig_genes Data frame of differentially expressed genes, containing IDs etc.

go_db Database of go to gene mappings (OrgDb/OrganismDb)

length_db Database of gene lengths (gff/TxDb)

doplot Include pwf plots?

adjust Minimum adjusted pvalue for 'significant.'

pvalue Minimum pvalue for 'significant.'
length_keytype Keytype to provide to extract lengths
go_keytype Keytype to provide to extract go IDs

 ${\tt goseq_method} \qquad {\tt Statistical\ test\ for\ goseq\ to\ use}.$

 $padjust_method$ Which method to use to adjust the pvalues.

bioc_length_db Source of gene lengths?

excel Print the results to an excel file?

... Extra parameters which I do not recall

252 simple_gostats

Value

Big list including: the pwd:pwf function, alldata:the godata dataframe, pvalue_histogram:p-value histograms, godata_interesting:the ontology information of the enhanced groups, term_table:the goterms with some information about them, mf_subset:a plot of the MF enhanced groups, mfp_plot:the pvalues of the MF group, bp_subset:a plot of the BP enhanced groups, bpp_plot, cc_subset, and ccp_plot

See Also

```
goseq GO.db
```

Examples

Description

GOstats has a couple interesting peculiarities: Chief among them: the gene IDs must be integers. As a result, I am going to have this function take a gff file in order to get the go ids and gene ids on the same page.

Usage

```
simple_gostats(sig_genes, go_db = NULL, gff = NULL, gff_df = NULL,
  universe_merge = "id", second_merge_try = "locus_tag",
  species = "fun", pcutoff = 0.1, conditional = FALSE,
  categorysize = NULL, gff_id = "ID", gff_type = "cds",
  excel = NULL, ...)
```

Arguments

```
sig_genes Input list of differentially expressed genes.

go_db Set of GOids, as before in the format ID/GO.

gff Annotation information for this genome.

gff_df I do not remember what this is for.

universe_merge Column from which to create the universe of genes.

second_merge_try

If the first universe merge fails, try this.

species Genbank organism to use.
```

simple_gprofiler 253

pcutoff	Pvalue cutoff for deciding significant.
conditional	Perform a conditional search?
categorysize	Category size below which to not include groups.
gff_id	key in the gff file containing the unique IDs.
gff_type	Gff column to use for creating the universe.
excel	Print the results to an excel file?
	More parameters!

More parameters!

Value

List of returns from GSEABase, Category, etc.

See Also

GSEABase Category

Examples

```
knickerbockers <- simple_gostats(sig_genes, gff_file, goids)</pre>
## End(Not run)
```

simple_gprofiler

Run searches against the web service g:Profiler.

Description

Thank you Ginger for showing me your thesis, gProfiler is pretty cool!

Usage

```
simple_gprofiler(sig_genes, species = "hsapiens", convert = TRUE,
 first_col = "logFC", second_col = "limma_logfc", do_go = TRUE,
 do_kegg = TRUE, do_reactome = TRUE, do_mi = TRUE, do_tf = TRUE,
 do_corum = TRUE, do_hp = TRUE, significant = TRUE,
 pseudo_gsea = TRUE, id_col = "row.names", excel = NULL)
```

Arguments

sig_genes	Guess! The set of differentially expressed/interesting genes.
species	Organism supported by gprofiler.
convert	Use gProfileR's conversion utility?
first_col	First place used to define the order of 'significant'.
second_col	If that fails, try a second column.

254 simple_gsva

do_go Perform GO search?
do_kegg Perform KEGG search?
do_reactome Perform reactome search?
do_mi Do miRNA search?

do_tf Search for transcription factors?

do_corum Do corum search?
do_hp Do the hp search?

significant Only return the statistically significant hits? pseudo_gsea Is the data in a ranked order by significance?

id_col Which column in the table should be used for gene ID crossreferencing? gPro-

filer uses Ensembl ids. So if you have a table of entrez or whatever, translate

it!

excel Print the results to an excel file?

Value

a list of results for go, kegg, reactome, and a few more.

See Also

gProfiler

Examples

```
## Not run:
   gprofiler_is_nice_and_easy <- simple_gprofiler(genes, species='mmusculus')
## End(Not run)</pre>
```

simple_gsva

Provide some defaults and guidance when attempting to use gsva.

Description

gsva seems to hold a tremendous amount of potential. Unfortunately, it is somewhat opaque and its requirements are difficult to pin down. This function will hopefully provide some of the requisite defaults and do some sanity checking to make it more likely that a gsva analysis will succeed.

```
simple_gsva(expt, datasets = "c2BroadSets", data_pkg = "GSVAdata",
    signatures = NULL, cores = 0, current_id = "ENSEMBL",
    required_id = "ENTREZID", orgdb = "org.Hs.eg.db", method = "gsva",
    kcdf = NULL, ranking = FALSE)
```

simple_mlseq 255

Arguments

expt Expt object to be analyzed.

datasets Name of the variable from which to acquire the gsva data, if it does not exist,

then data() will be called upon it.

data_pkg What package contains the requisite dataset?

signatures Provide an alternate set of signatures (GeneSetCollections)

cores How many CPUs to use?

current_id Where did the IDs of the genes come from?

required_id gsva (I assume) always requires ENTREZ IDs, but just in case this is a parame-

ter.

orgdb What is the data source for the rownames()?

method Which gsva method to use?

kcdf Options for the gsva methods.

ranking another gsva option.

Value

List containing three elements: first a modified expressionset using the result of gsva in place of the original expression data; second the result from gsva, and third a data frame of the annotation data for the gene sets in the expressionset. This seems a bit redundant, perhaps I should revisit it?

simple_mlseq	Use MLSeq to seek important genes given an experimental factor and
	an expressionSet.

Description

MLSeq provides interfaces to the various machine learning methodologies from caret in the context of RNASeq data. It furthermore provides bridge methods which provide links from the normalization methods from limma/edgeR/DESeq2 to the various ML methods in caret.

```
simple_mlseq(expt, comparison = "condition", number_by_var = 100,
  ceiling_factor = 1/3, training_number = 2, training_repeats = 10,
  training_method = "repeatedcv", classify_method = "svmRadial",
  classify_preprocess = "deseq-rlog", reference_factor = NULL, ...)
```

256 simple_pathview

Arguments

expt Input expressionset. Metadata column from the experimental design for the search. comparison Take the top-n most variant genes. Use all genes if null. number_by_var Define how many columns(experimental samples) to take when sampling the ceiling_factor expressionset for training vs. testing data. training_number Iterations when training. training_repeats Also iterations when training... (in other words, I dunno). training_method which caret method to train? classify_method which caret method to classify the data? classify_preprocess

> What factor in the experimental metadata contains the reference? Extra arguments

Which mlseq method to preprocess/normalize the data?

simple_pathview

reference_factor

Print some data onto KEGG pathways.

Description

KEGGREST and pathview provide neat functions for coloring molecular pathways with arbitrary data. Unfortunately they are somewhat evil to use. This attempts to alleviate that.

Usage

```
simple_pathview(path_data, indir = "pathview_in", outdir = "pathview",
  pathway = "all", species = "lma", from_list = NULL,
  to_list = NULL, suffix = "_colored", filenames = "id",
  fc_column = "limma_logfc", format = "png", verbose = TRUE)
```

Arguments

path_data	Some differentially expressed genes.
indir	Directory into which the unmodified kegg images will be downloaded (or already exist).
outdir	Directory which will contain the colored images.
pathway	Perform the coloring for a specific pathway?
species	Kegg identifier for the species of interest.

simple_topgo 257

from_list	Regex to help in renaming KEGG categories/gene names from one format to another.
to_list	Regex to help in renaming KEGG categories/gene names from one format to another.
suffix	Add a suffix to the completed, colored files.
filenames	Name the final files by id or name?
fc_column	What is the name of the fold-change column to extract?
format	Format of the resulting images, I think only png really works well.
verbose	When on, this function is quite chatty.

Value

A list of some information for every KEGG pathway downloaded/examined. This information includes: a. The filename of the final image for each pathway. b. The number of genes which were found in each pathway image. c. The number of genes in the 'up' category d. The number of genes in the 'down' category

See Also

Ramigo pathview

Examples

simple_topgo

Perform a simplified topgo analysis.

Description

This will attempt to make it easier to run topgo on a set of genes.

```
simple_topgo(sig_genes, goid_map = "id2go.map", go_db = NULL,
    pvals = NULL, limitby = "fisher", limit = 0.1, signodes = 100,
    sigforall = TRUE, numchar = 300, selector = "topDiffGenes",
    pval_column = "adj.P.Val", overwrite = FALSE, densities = FALSE,
    pval_plots = TRUE, excel = NULL, ...)
```

258 simple_varpart

Arguments

Data frame of differentially expressed genes, containing IDs any other columns. sig_genes goid_map File containing mappings of genes to goids in the format expected by topgo. go_db Data frame of the goids which may be used to make the goid_map. pvals Set of pvalues in the DE data which may be used to improve the topgo results. limitby Test to index the results by. limit Ontology pvalue to use as the lower limit. signodes I don't remember right now. sigforall Provide the significance for all nodes? numchar Character limit for the table of results. selector Function name for choosing genes to include. pval_column Column from which to acquire scores. overwrite Yeah I do not remember this one either. densities Densities, yeah, the densities...

pval_plots Include pvalue plots of the results a la clusterprofiler?

excel Print the results to an excel file?

... Other options which I do not remember right now!

Value

Big list including the various outputs from topgo

See Also

topGO

simple_varpart	I think varpart() is a bad name for a function, so I will rename it.

Description

I think varpart() is a bad name for a function, so I will rename it.

Usage

```
simple_varpart(...)
```

Arguments

... Arguments for varpart.

simple_xcell 259

simple_xcell

Invoke xCell and pretty-ify the result.

Description

I initially thought xCell might prove the best tool/method for exploring cell deconvolution. I slowly figured out its limitations, but still think it seems pretty nifty for its use case. Thus this function is intended to make invoking it easier/faster.

Usage

```
simple_xcell(expt, label_size = NULL, col_margin = 6,
  row_margin = 12, ...)
```

Arguments

expt Expressionset to query.

label_size How large to make labels when printing the final heatmap.

col_margin Used by par() when printing the final heatmap.

row_margin Ibid.

... Extra arguments when normalizing the data for use with xCell.

Value

Small list providing the output from xCell, the set of signatures, and heatmap.

sm Silence

Description

Some libraries/functions just won't shut up. Ergo, silence, peasant! This is a simpler silence peasant.

Usage

```
sm(..., wrap = TRUE)
```

Arguments

... Some code to shut up.
wrap Wrap the invocation and try again if it failed?

Value

Whatever the code would have returned.

260 snps_vs_intersections

snps_vs_genes	Make a summary of the observed snps/gene
311p3_v3_8c11c3	make a summary of the observed supsigene

Description

Make a summary of the observed snps/gene

Usage

```
snps_vs_genes(expt, snp_result, start_col = "start", end_col = "end")
```

Arguments

expt The original expressionset snp_result The result from get_snp_sets()

start_col Which column provides the start of each gene?

end_col and the end column of each gene?

Value

a fun list with some information by gene.

```
snps_vs_intersections Cross reference observed variants against the transcriptome annotation.
```

Description

This function should provide counts of how many variant positions were observed with respect to each chromosome and with respect to each annotated sequence (currently this is limited to CDS, but that is negotiable).

Usage

```
snps_vs_intersections(expt, snp_result)
```

Arguments

expt The original expressionset. This provides the annotation data.

 $snp_result \qquad \qquad The \ result \ from \ get_snp_sets \ or \ count_expt_snps.$

Value

List containing the set of intersections in the conditions contained in snp_result, the summary of numbers of variants per chromosome, and summary of numbers per gene.

snp_by_chr 261

puis inem inio a paraitetizable aata structure.	snp_by_chr	The real worker. This extracts positions for a single chromosome and puts them into a parallelizable data structure.
---	------------	--

Description

The real worker. This extracts positions for a single chromosome and puts them into a parallelizable data structure.

Usage

```
snp_by_chr(medians, chr_name = "01", limit = 1)
```

Arguments

medians A set of medians by position to look through

chr_name Chromosome name to search

limit Minimum number of median hits/position to count as a snp.

Value

A fun list by chromosome!

subset_expt	riment
-------------	--------

Description

Sometimes an experiment has too many parts to work with conveniently, this operation allows one to break it into smaller pieces.

Usage

```
subset_expt(expt, subset = NULL, coverage = NULL)
```

Arguments

expt Expt chosen to extract a subset of data.

subset Valid R expression which defines a subset of the design to keep.

coverage Request a minimum coverage/sample rather than text-based subset.

Value

metadata Expt class which contains the smaller set of data.

See Also

Biobase pData exprs fData

Examples

```
## Not run:
smaller_expt = expt_subset(big_expt, "condition=='control'")
all_expt = expt_subset(expressionset, "") ## extracts everything
## End(Not run)
```

subset_ontology_search

Perform ontology searches on up/down subsets of differential expression data.

Description

In the same way all_pairwise() attempts to simplify using multiple DE tools, this function seeks to make it easier to extract subsets of differentially expressed data and pass them to goseq, clusterProfiler, topGO, GOstats, and gProfiler.

Usage

```
subset_ontology_search(changed_counts, doplot = TRUE, do_goseq = TRUE,
do_cluster = TRUE, do_topgo = TRUE, do_gostats = TRUE,
do_gprofiler = TRUE, according_to = "limma", ...)
```

Arguments

changed_counts List of changed counts as ups and downs.

doplot Include plots in the results?
do_goseq Perform goseq search?

do_cluster Perform clusterprofiler search?
do_topgo Perform topgo search?

do_gostats Perform gostats search?
do_gprofiler Do a gprofiler search?

... Extra arguments!

Value

List of ontology search results, up and down for each contrast.

See Also

goseq clusterProfiler topGO goStats gProfiler

sum_eupath_exon_counts

I want an easy way to sum counts in eupathdb-derived data sets. These have a few things which should make this relatively easy. Notably: The gene IDs look like: "exon_ID-1 exon_ID-2 exon_ID-3" Therefore we should be able to quickly merge these.

Description

I want an easy way to sum counts in eupathdb-derived data sets. These have a few things which should make this relatively easy. Notably: The gene IDs look like: "exon_ID-1 exon_ID-2 exon_ID-3" Therefore we should be able to quickly merge these.

Usage

```
sum_eupath_exon_counts(counts)
```

Arguments

counts

Matrix/df/dt of count data.

Value

The same data type but with the exons summed.

sum_exon_widths

Given a data frame of exon counts and annotation information, sum the exons.

Description

This function will merge a count table to an annotation table by the child column. It will then sum all rows of exons by parent gene and sum the widths of the exons. Finally it will return a list containing a df of gene lengths and summed counts.

Usage

```
sum_exon_widths(data = NULL, gff = NULL, annotdf = NULL,
parent = "Parent", child = "row.names")
```

Arguments

data	Count tables of exons.
------	------------------------

gff Gff filename.

annotdf Dataframe of annotations (probably from load_gff_annotations).

parent Column from the annotations with the gene names. child Column from the annotations with the exon names.

264 tnseq_saturation

Value

List of 2 data frames, counts and lengths by summed exons.

Author(s)

Keith Hughitt with some modifications by atb.

See Also

```
rtracklayer load_gff_annotations
```

Examples

```
## Not run:
summed <- sum_exons(counts, gff='reference/xenopus_laevis.gff.xz')
## End(Not run)</pre>
```

tnseq_saturation

Make a plot and some simple numbers about tnseq saturation

Description

This function takes as input a tab separated file from essentiality_tas.pl This is a perl script written to read a bam alignment of tnseq reads against a genome and count how many hits were observed on every TA in the given genome. It furthermore has some logic to tell the difference between reads which were observed on the forward vs. reverse strand as well as reads which appear to be on both strands (eg. they start and end with 'TA').

Usage

```
tnseq_saturation(data, column = "Reads")
```

Arguments

data data to plot

column which column to use for plotting

Value

A plot and some numbers:

- 1. maximum_reads = The maximum number of reads observed in a single position.
- 2. hits_by_position = The full table of hits / position
- 3. num_hit_table = A table of how many times every number of hits was observed.
- 4. $eq_0 = How many times were 0 hits observed?$
- 5. $gt_1 = How many positions have > 1 hit?$

topDiffGenes 265

```
6. gt_2 = How many positions have > 2 hits?
```

- 7. $gt_4 = How many positions have > 4 hits?$
- 8. $gt_8 = \text{How many positions have} > 8 \text{ hits}$?
- 9. $gt_16 = How many positions have > 16 hits?$
- 10. $gt_32 = How many positions have > 32 hits?$
- 11. ratios = Character vector of the ratios of each number of hits vs. 0 hits.
- 12. hit_positions = 2 column data frame of positions and the number of observed hits.
- 13. hits_summary = summary(hit_positions)
- 14. plot = Histogram of the number of hits observed.

See Also

ggplot2

Examples

```
## Not run:
input <- "preprocessing/hpgl0837/essentiality/hpgl0837-trimmed_ca_ta-v0M1.wig"
saturation <- tnseq_saturation(file=input)
## End(Not run)</pre>
```

topDiffGenes

A very simple selector of strong scoring genes (by p-value)

Description

This function was provided in the topGO documentation, but not defined. It was copied/pasted here. I have ideas for including up/down expression but have so far deemed them not needed because I am feeding topGO already explicit lists of genes which are up/down/whatever. But it still is likely to be useful to be able to further subset the data.

Usage

```
topDiffGenes(allScore)
```

Arguments

allScore

The scores of the genes

266 topgo_trees

topgo_tak

Make pretty tables out of topGO data

Description

The topgo function GenTable is neat, but it needs some simplification to not be obnoxious.

Usage

```
topgo_tables(result, limit = 0.1, limitby = "fisher", numchar = 300,
  orderby = "fisher", ranksof = "fisher")
```

Arguments

result Topgo result.

limit Pvalue limit defining 'significant'.

limitby Type of test to perform.

numchar How many characters to allow in the description?

orderby Which of the available columns to order the table by?
ranksof Which of the available columns are used to rank the data?

Value

prettier tables

See Also

topGO

topgo_trees

Print trees from topGO.

Description

The tree printing functionality of topGO is pretty cool, but difficult to get set correctly.

```
topgo_trees(tg, score_limit = 0.01, sigforall = TRUE,
  do_mf_fisher_tree = TRUE, do_bp_fisher_tree = TRUE,
  do_cc_fisher_tree = TRUE, do_mf_ks_tree = FALSE,
  do_bp_ks_tree = FALSE, do_cc_ks_tree = FALSE,
  do_mf_el_tree = FALSE, do_bp_el_tree = FALSE,
  do_cc_el_tree = FALSE, do_mf_weight_tree = FALSE,
  do_bp_weight_tree = FALSE, do_cc_weight_tree = FALSE,
  parallel = FALSE)
```

transform_counts 267

Arguments

```
Data from simple_topgo().
tg
                  Score limit to decide whether to add to the tree.
score_limit
sigforall
                  Add scores to the tree?
do_mf_fisher_tree
                  Add the fisher score molecular function tree?
do_bp_fisher_tree
                  Add the fisher biological process tree?
do_cc_fisher_tree
                  Add the fisher cellular component tree?
do_mf_ks_tree
                 Add the ks molecular function tree?
do_bp_ks_tree
                 Add the ks biological process tree?
do_cc_ks_tree
                 Add the ks cellular component tree?
do_mf_el_tree
                 Add the el molecular function tree?
do_bp_el_tree
                 Add the el biological process tree?
do_cc_el_tree
                 Add the el cellular component tree?
do_mf_weight_tree
                  Add the weight mf tree?
do_bp_weight_tree
                  Add the bp weighted tree?
do_cc_weight_tree
                  Add the guess
parallel
                  Perform operations in parallel to speed this up?
```

Value

Big list including the various outputs from topgo.

See Also

topGO

Description

the add argument is only important if the data was previously cpm'd because that does a +1, thus this will avoid a double+1 on the data.

```
transform_counts(count_table, design = NULL, transform = "raw",
  base = NULL, ...)
```

268 unAsIs

Arguments

count_table A matrix of count data

design Sometimes the experimental design is also required.

transform A type of transformation to perform: log2/log10/log.

base Other log scales?

... Options I might pass from other functions are dropped into arglist.

Value

dataframe of transformed counts.

See Also

limma

Examples

```
## Not run:
  filtered_table = transform_counts(count_table, transform='log2', converted='cpm')
## End(Not run)
```

unAsIs

Remove the AsIs attribute from some data structure.

Description

Notably, when using some gene ontology libraries, the returned data structures include information which is set to type 'AsIs' which turns out to be more than slightly difficult to work with.

Usage

```
unAsIs(stuff)
```

Arguments

stuff

The data from which to remove the AsIs classification.

u_plot 269

u_plot	Plot the rank order svd\$u elements to get a view of how much the first genes contribute to the total variance by PC.
	· ·

Description

Plot the rank order svd\$u elements to get a view of how much the first genes contribute to the total variance by PC.

Usage

```
u_plot(plotted_us)
```

Arguments

plotted_us a list of svd\$u elements

Value

a recordPlot() plot showing the first 3 PCs by rank-order svd\$u.

varpart	Use variancePartition to try and understand where the variance lies in a data set.	

Description

variancePartition is the newest toy introduced by Hector.

Usage

```
varpart(expt, predictor = NULL, factors = c("condition", "batch"),
  chosen_factor = "batch", do_fit = FALSE, cor_gene = 1, cpus = 6,
  genes = 40, parallel = TRUE, deprecated = TRUE,
  modify_expt = TRUE)
```

Arguments

expt	Some data
predictor	Non-categorical predictor factor with which to begin the model.
factors	Character list of columns in the experiment design to query
chosen_factor	When checking for sane 'batches', what column to extract from the design?
do_fit	Perform a fitting using variancePartition?
cor_gene	Provide a set of genes to look at the correlations, defaults to the first gene.

270 varpart_summaries

cpus Number cpus to use

genes Number of genes to count.

parallel use doParallel?

deprecated I want to rename this, but not immediately.

modify_expt Add annotation columns with the variance/factor?

Details

Tested in 19varpart.R.

Value

partitions List of plots and variance data frames

See Also

doParallel variancePartition

varpart_summaries

 $Attempt\ to\ use\ variance Partition's\ fit Var Part Model()\ function.$

Description

Note the word 'attempt'. This function is so ungodly slow that it probably will never be used.

Usage

```
varpart_summaries(expt, factors = c("condition", "batch"), cpus = 6)
```

Arguments

expt Input expressionset. factors Set of factors to query

cpus Number of cpus to use in doParallel.

Value

Summaries of the new model, in theory this would be a nicely batch-corrected data set.

See Also

variancePartition

what_happened 271

what	happened

Print a string describing what happened to this data.

Description

Sometimes it is nice to have a string like: log2(cpm(data)) describing what happened to the data.

Usage

```
what_happened(expt = NULL, transform = "raw", convert = "raw",
norm = "raw", filter = "raw", batch = "raw")
```

Arguments

expt The expressionset.

transform How was it transformed?

convert How was it converted?

norm How was it normalized?

filter How was it filtered?

batch How was it batch-corrected?

Value

An expression describing what has been done to this data.

See Also

```
create_expt
```

write_basic

Writes out the results of a basic search using write_de_table()

Description

Looking to provide a single interface for writing tables from basic and friends.

Usage

```
write_basic(data, ...)
```

Arguments

data Output from basic_pairwise()
... Options for writing the xlsx file.

272 write_cp_data

Details

Tested in test_26basic.R

See Also

```
write_de_table
```

Examples

```
## Not run:
    finished_comparison <- basic_pairwise(expressionset)
    data_list <- write_basic(finished_comparison)
## End(Not run)</pre>
```

write_cp_data

Make a pretty table of clusterprofiler data in excel.

Description

It is my intention to make a function like this for each ontology tool in my repetoire

Usage

```
write_cp_data(cp_result, excel = "excel/clusterprofiler.xlsx",
  wb = NULL, add_trees = TRUE, order_by = "qvalue", pval = 0.1,
  add_plots = TRUE, height = 15, width = 10, decreasing = FALSE,
  ...)
```

Arguments

cp_result A set of results from simple_clusterprofiler().

excel An excel file to which to write some pretty results.

wb Workbook object to write to.

Include topgoish ontology trees?

add_trees Include topgoish ontology trees?
order_by What column to order the data by?

pval Choose a cutoff for reporting by p-value.

height Height of included plots.

width and their width.
decreasing which direction?

Extra arguments are passed to arglist.

write_deseq 273

Value

The result from openxlsx in a prettyified xlsx file.

See Also

openxlsx goseq

write_deseq

Writes out the results of a deseq search using write_de_table()

Description

Looking to provide a single interface for writing tables from deseq and friends.

Usage

```
write_deseq(data, ...)
```

Arguments

data Output from deseq_pairwise()
... Options for writing the xlsx file.

Details

Tested in test_24deseq.R

See Also

```
DESeq2 write_xls
```

Examples

```
## Not run:
    finished_comparison = deseq_pairwise(expressionset)
    data_list = write_deseq(finished_comparison)
## End(Not run)
```

274 write_de_table

write_de_table

Writes out the results of a single pairwise comparison.

Description

However, this will do a couple of things to make one's life easier: 1. Make a list of the output, one element for each comparison of the contrast matrix. 2. Write out the results() output for them in separate sheets in excel. 3. Since I have been using qvalues a lot for other stuff, add a column.

Usage

```
write_de_table(data, type = "limma", ...)
```

Arguments

data Output from results().
type Which DE tool to write.

... Parameters passed downstream, dumped into arglist and passed, notably the

number of genes (n), the coefficient column (coef)

Details

Tested in test_24deseq.R Rewritten in 2016-12 looking to simplify combine_de_tables(). That function is far too big, this should become a template for that.

Value

List of data frames comprising the toptable output for each coefficient, I also added a qualue entry to these toptable() outputs.

See Also

```
write_xls
```

Examples

```
## Not run:
    finished_comparison = eBayes(deseq_output)
    data_list = write_deseq(finished_comparison, workbook="excel/deseq_output.xls")
## End(Not run)
```

write_edger 275

write_edger

Writes out the results of a edger search using write_de_table()

Description

Looking to provide a single interface for writing tables from edger and friends.

Usage

```
write_edger(data, ...)
```

Arguments

```
data Output from deseq_pairwise()
... Options for writing the xlsx file.
```

Details

Tested in test_26edger.R

See Also

```
limma toptable write_xls
```

Examples

```
## Not run:
    finished_comparison <- edger_pairwise(expressionset)
    data_list <- write_edger(finished_comparison)
## End(Not run)</pre>
```

write_expt

Make pretty xlsx files of count data.

Description

Some folks love excel for looking at this data. ok.

```
write_expt(expt, excel = "excel/pretty_counts.xlsx", norm = "quant",
  violin = FALSE, convert = "cpm", transform = "log2",
  batch = "sva", filter = TRUE, ...)
```

276 write_goseq_data

Arguments

expt An expressionset to print.

excel Filename to write.

norm Normalization to perform.
violin Include violin plots?
convert Conversion to perform.
transform Transformation used.
batch Batch correction applied.

filter Filtering method used.

... Parameters passed down to methods called here (graph_metrics, etc).

Details

Tested in test_03graph_metrics.R This performs the following: Writes the raw data, graphs the raw data, normalizes the data, writes it, graphs it, and does a median-by-condition and prints that. I replaced the openxlsx function which writes images into xlsx files with one which does not require an opening of a pre-existing plotter. Instead it (optionally)opens a pdf device, prints the plot to it, opens a png device, prints to that, and inserts the resulting png file. Thus it sacrifices some flexibility for a hopefully more consistent behaivor. In addition, one may use the pdfs as a set of images importable into illustrator or whatever.

Value

A big honking excel file and a list including the dataframes and images created.

See Also

```
openxlsx Biobase normalize_expt graph_metrics
```

Examples

```
## Not run:
  excel_sucks <- write_expt(expt)
## End(Not run)</pre>
```

write_goseq_data

Make a pretty table of goseq data in excel.

Description

It is my intention to make a function like this for each ontology tool in my repetoire

write_gostats_data 277

Usage

```
write_goseq_data(goseq_result, excel = "excel/goseq.xlsx", wb = NULL,
   add_trees = TRUE, order_by = "qvalue", pval = 0.1,
   add_plots = TRUE, height = 15, width = 10, decreasing = FALSE,
   ...)
```

Arguments

goseq_result A set of results from simple_goseq().

excel An excel file to which to write some pretty results.

wb Workbook object to write to.
add_trees Include topgoish ontology trees?
order_by What column to order the data by?

pval Choose a cutoff for reporting by p-value.

add_plots Include some pvalue plots in the excel output?

height Height of included plots.

width and their width.

decreasing In forward or reverse order?

... Extra arguments are passed to arglist.

Value

The result from openxlsx in a prettyified xlsx file.

See Also

openxlsx goseq

write_gostats_data

Make a pretty table of gostats data in excel.

Description

It is my intention to make a function like this for each ontology tool in my repetoire

```
write_gostats_data(gostats_result, excel = "excel/gostats.xlsx",
  wb = NULL, add_trees = TRUE, order_by = "qvalue", pval = 0.1,
  add_plots = TRUE, height = 15, width = 10, decreasing = FALSE,
  ...)
```

278 write_go_xls

Arguments

gostats_result A set of results from simple_gostats().

excel An excel file to which to write some pretty results.

wb Workbook object to write to.
add_trees Include topgoish ontology trees?
order_by Which column to order the data by?
pval Choose a cutoff for reporting by p-value.
add_plots Include some pvalue plots in the excel output?

height Height of included plots.

width and their width. decreasing Which order?

... Extra arguments are passed to arglist.

Value

The result from openxlsx in a prettyified xlsx file.

See Also

openxlsx gostats

write_go_xls	Write gene ontology tables for excel	
--------------	--------------------------------------	--

Description

Combine the results from goseq, cluster profiler, topgo, and gostats and drop them into excel. Hopefully with a relatively consistent look.

Usage

```
write_go_xls(goseq, cluster, topgo, gostats, gprofiler,
  file = "excel/merged_go", dated = TRUE, n = 30,
  overwritefile = TRUE)
```

Arguments

goseq The goseq result from simple_goseq()
cluster The result from simple_clusterprofiler()

topgo Guess gostats Yep, ditto gprofiler woo hoo!

file the file to save the results.

dated date the excel file

n the number of ontology categories to include in each table.

overwritefile overwrite an existing excel file

write_gprofiler_data 279

Value

the list of ontology information

See Also

openxlsx goseq clusterProfiler goStats topGO gProfiler

```
write_gprofiler_data Write some excel results from a gprofiler search.
```

Description

Gprofiler is pretty awesome. This function will attempt to write its results to an excel file.

Usage

```
write_gprofiler_data(gprofiler_result, wb = NULL,
  excel = "excel/gprofiler_result.xlsx", order_by = "recall",
  add_plots = TRUE, height = 15, width = 10, decreasing = FALSE,
  ...)
```

Arguments

```
gprofiler_result
```

The result from simple_gprofiler().

wb Optional workbook object, if you wish to append to an existing workbook.

excel Excel file to which to write.

order_by Which column to order the data by?

add_plots Add some pvalue plots? height Height of included plots?

width And their width. decreasing Which order?

... More options, not currently used I think.

Value

A prettyified table in an xlsx document.

See Also

openxlsx gProfiler

write_limma

Writes out the results of a limma search using write_de_table()

Description

Looking to provide a single interface for writing tables from limma and friends.

Usage

```
write_limma(data, ...)
```

Arguments

```
data Output from limma_pairwise()
... Options for writing the xlsx file.
```

Details

Tested in test 21limma.R

See Also

```
write_de_table
```

Examples

```
## Not run:
    finished_comparison = limma_pairwise(expressionset)
    data_list = write_limma(finished_comparison)
## End(Not run)
```

```
write_subset_ontologies
```

Write gene ontology tables for data subsets

Description

Given a set of ontology results, this attempts to write them to an excel workbook in a consistent and relatively easy-to-read fashion.

```
write_subset_ontologies(kept_ontology, outfile = "excel/subset_go",
  dated = TRUE, n = NULL, overwritefile = TRUE, add_plots = TRUE,
  table_style = "TableStyleMedium9", ...)
```

write_suppa_table 281

Arguments

kept_ontology A result from subset_ontology_search()

outfile Workbook to which to write.

dated Append the year-month-day-hour to the workbook.

n How many ontology categories to write for each search

overwritefile Overwrite an existing workbook?

add_plots Add the various p-value plots to the end of each sheet?

table_style The chosen table style for excel

... some extra parameters

Value

a set of excel sheet/coordinates

See Also

openxlsx

Examples

write_suppa_table

Take a set of results from suppa and attempt to write it to a pretty xlsx file.

Description

Suppa provides a tremendous amount of output, this attempts to standardize those results and print them to an excel sheet.

```
write_suppa_table(table, annotations = NULL, by_table = "gene_name",
  by_annot = "ensembl_gene_id", columns = "default",
  excel = "excel/suppa_table.xlsx")
```

282 write_topgo_data

Arguments

table Result table from suppa.

annotations Set of annotation data to include with the suppa result.

by_table Use this column to merge the annotations and data tables from the perspective

of the data table.

of the annotations.

columns Choose a subset of columns to include, or leave the defaults.

excel Provide an excel file to write.

Value

Data frame of the merged data.

write_topgo_data

Make a pretty table of topgo data in excel.

Description

It is my intention to make a function like this for each ontology tool in my repetoire

Usage

```
write_topgo_data(topgo_result, excel = "excel/topgo.xlsx", wb = NULL,
  order_by = "fisher", decreasing = FALSE, pval = 0.1,
  add_plots = TRUE, height = 15, width = 10, ...)
```

Arguments

topgo_result A set of results from simple_topgo().

excel An excel file to which to write some pretty results.

wb Workbook object to write to.

order_by Which column to order the results by?

decreasing In forward or reverse order?

pval Choose a cutoff for reporting by p-value.

add_plots Include some pvalue plots in the excel output?

height Height of included plots.

width and their width.

Extra arguments are passed to arglist.

Value

The result from openxlsx in a prettyified xlsx file.

write_xls 283

See Also

openxlsx topgo

write_xls

Write a dataframe to an excel spreadsheet sheet.

Description

I like to give folks data in any format they prefer, even though I sort of hate excel. Most people I work with use it, so therefore I do too. This function has been through many iterations, first using XLConnect, then xlsx, and now openxlsx. Hopefully this will not change again.

Usage

```
write_xls(data = "undef", wb = NULL, sheet = "first", excel = NULL,
rownames = TRUE, start_row = 1, start_col = 1, title = NULL, ...)
```

Arguments

data	Data frame to print.
wb	Workbook to which to write.
sheet	Name of the sheet to write.
excel	Filename of final excel workbook to write
rownames	Include row names in the output?
start_row	First row of the sheet to write. Useful if writing multiple tables.
start_col	First column to write.
title	Title for this xlsx table.
	Set of extra arguments given to openxlsx.

Value

List containing the sheet and workbook written as well as the bottom-right coordinates of the last row/column written to the worksheet.

See Also

openxlsx

Examples

```
## Not run:
    xls_coords <- write_xls(dataframe, sheet="hpgl_data")
    xls_coords <- write_xls(another_df, sheet="hpgl_data", start_row=xls_coords$end_col)
## End(Not run)</pre>
```

284 xlsx_plot_png

xlsx_plot_png An attempt to improve the behaivor of openxlsx's plot inserter.

Description

The functions provided by openxlsx for adding plots to xlsx files are quite nice, but they can be a little annoying. This attempt to catch some corner cases and potentially save an extra svg-version of each plot inserted.

Usage

```
xlsx_plot_png(a_plot, wb = NULL, sheet = 1, width = 6, height = 6,
res = 90, plotname = "plot", savedir = "saved_plots",
fancy_type = "pdf", start_row = 1, start_col = 1,
file_type = "png", units = "in", ...)
```

Arguments

a_plot	The plot provided
wb	Workbook to which to write.
sheet	Name or number of the sheet to which to add the plot.
width	Plot width in the sheet.
height	Plot height in the sheet.
res	Resolution of the png image inserted into the sheet.
plotname	Prefix of the pdf file created.
savedir	Directory to which to save pdf copies of the plots.
fancy_type	Plot publication quality images in this format.
start_row	Row on which to place the plot in the sheet.
start_col	Column on which to place the plot in the sheet.
file_type	Currently this only does pngs, but perhaps I will parameterize this.
units	Units for the png plotter.
	Extra arguments are passed to arglist (Primarily for vennerable plots which are odd)

Value

A list containing the result of the tryCatch used to invoke the plot prints.

See Also

openxlsx

ymxb_print 285

Examples

```
## Not run:
  fun_plot <- plot_pca(stuff)$plot
  try_results <- xlsx_plot_png(fun_plot)
## End(Not run)</pre>
```

ymxb_print

Print a model as y = mx + b just like in grade school!

Description

Because, why not!?

Usage

```
ymxb_print(model)
```

Arguments

model

Model to print from glm/lm/robustbase.

Value

a string representation of that model.

%:::%

R CMD check is super annoying about :::.

Description

In a fit of pique, I did a google search to see if anyone else has been annoyed in the same was as I. I was in no way surprised to see that Yihui Xie was, and in his email to r-devel in 2013 he proposed a game of hide-and-seek; a game which I am repeating here.

Usage

```
pkg %:::% fun
```

Arguments

pkg on the left hand side fun on the right hand side

Details

This just implements ::: as an infix operator that will not trip check.
